SIDECAR ATTACHMENTS.

MIDDLETON'S.

MIDDLETON'S make Sidecars, they do au' all.

MIDDLETON'S Flier still dodging the coppers.

MIDDLETON'S Sidecars have won more gold medals, cups, reliability trials, and records than most of you have had hot dinners.

MIDDLETON'S Sidecars tout drag der motor unt wear in ond, or dake zo much pedrol. Goot! I pay vud. Special terms to Scotchmen.

MIDDLETON'S recognise that no lady, however smart, can fancy herself or swank if sitting in a Ford, so always advise a sidecar.

MIDDLETON'S have nothing to say against Henry. Like the man in a frock coat, with bowler hat and brown boots, Henry doesn't realise what one looks like in his car.

MIDDLETON'S can only supply a limited number for Whitsun, so look slippy.

MIDDLETON'S.—That's the name you careful teetotal chaps; now push the boat out and buy the wife a sidecar. Better to do your own taking out you know.—27, Strand Green Rd., Fishbury Park, N.4, near Tube. Phone: Hornsey 1584. [6281]

RENNOC Sidecar Works, 86, Victoria Rd., Tollington Park, Stroud Green, London, N.4. (George C. Conner, Managing Director.) 'Phone: Hornsey 850. [18860]

F.R.S. ELECTRIC

Sidecar sets, complete, as above 153/-
Lamps only, with handle-bar fittings 45/-

MAGNETO LAMPS.

A new method of obtaining light, suitable for two lamps, from the extra current produced by magneto, which has been wasted so far. As soon as engine starts the lamps light. Perfectly simple and foolproof. No trouble in future to get your lamps lit. A accumulator is fitted into box for use when machine is at a standstill.

Complete Set 123/6

This is a small fitting to enable owners of gas lamps fitted with burners of the Ron type (round stem) to make their lamp into electric. The "adapter" fits over the existing burner with a tight fit, and is connected to an electric wire and battery.

BRITISH HORN
Price 21/6.

For Solo machines. This set contains head lamp and tail lamp of the latest approved design, with adjustable handle-bar fittings. The box to fit on the top tube contains a 4-volt accumulator and a switch, giving sufficient light for the two lamps for approx. 10 hours at one 2 amp. fit, without doubt, fills a long-felt want for solo machine lighting.

F.R.S. LAMPS, "BEAM" Works, Persnore Street, BIRMINGHAM.

CARS FOR SALE.

1917 or 1907? It doesn't matter, they're all equally good running order when my staff of 30 experts have done with them. I say it with pride that some of my 1907 cars run better and will probably give better service than many 1917 models offered elsewhere. Also my descriptions may be relied on and dates advertised are guaranteed accurate.—Cox (below).

1914 1/2 hp. Warwick Box Auto-carrier, £60; A.C. 5-wheel sociable, runs really nicely, £70; 12hp. l'orman 2-seater, mag., £95; 15hp. R. O. NYE, 36, Gleneldon Rd., Streatham, London (3 years' active service M.T.), 15 years' experience motor cycle trade, gives unbiased advice on purchase motor cycles, light cars, etc.; sales attended; highest references, motor press, etc. [1093]

F. G. HERRTAGE, 10 years' practical experience, offers unbiased advice on the purchase of new and second-hand motor cycles; machines examined and reported on; distance no object.—48, Clarendon Rd., Putney, S.W.15. [2693]

GOVERNMENT Sales of Motor Cycles.—Two practical motor engineers, attending above sales, are prepared to secure bargains for readers, sale or commission.—Write, stating requirements, to Box L1,271, c/o *The Motor Cycle*. [1186]

INSURANCE.

FOR Insurance of all kinds (specially motor), apply, Ernest J. Bass, Insurance Broker, Bishops Stortford. [6093]

CHEAPEST Motor Cycle Rates, premiums from 10/-.—F. Payne and Co., Insurance Brokers, 37, Gt. Tower St., E.C.3. [9239]

ROY'S, Ltd.—Motor cycle insurance at Lloyd's. Lowest premiums, payable yearly, quarterly, or monthly. Write for prospectus.—170, Gt. Portland St., London. [7734]

THE Lowest Rates for motor and other insurance, obtainable from Tharp's, 9, Norton Folgate, Bishopsgate, E.1. Tel.: L.W. 274; and Irvinghoe, Grove Hill, Woodford, E.18. [8113]

COVER your motor cycle by The Bell (at Lloyd's) comprehensive policy.—For prospectus and full particulars apply R. G. Howard, 5, Moorgate St., Buildings, London, E.C.2. [9318]

COMPLETE Comprehensive Policies. Motor cycles from 37/6; Morgans, 75/-; immediate repairs permit.—Wrigleys, Lancashire's Premier Motor Insurance Brokers, The Corner, Houghton St., Southport. [1592]

DREADNOUGHT Motor Cycle Policies at Lloyd's. Premiums from 21/7 1/2 per annum, payable yearly, quarterly, or monthly. Before insuring elsewhere, write for prospectus, Roys, Ltd., 170, Gt. Portland St., London. [0994]

"THE Motor Cycle" Insurance Policy (subscribed by Lloyd's Underwriters) covers motor cycle or cycles and sidecars used for private purposes. Complete comprehensive cover. Maximum benefits, minimum rates. Free weekly copy of "The Motor Cycle" to all policy holders paying a premium of £37/6 or over.—Full particulars and prospectus on application, The Manager, "The Motor Cycle" Insurance Department, 20, Tudor St., London, E.C.4. [0995]

TUITION.

SIDECAR Driving.—Ladies and gentlemen quickly made proficient.—41, Ashford Rd., Cricklewood. [9584]

SIDECAR Driving Lessons by private owner, 15 years' experience, mechanism also taught.—C., Salisbury House, Hazlitt Rd., W. Kensington (near Olympia). [X1209]

MOTOR Tuition.—The British School of Motoring, Ltd., gives the highest standard of training in driving, mechanism, and repairs for the lowest fees in England. Call, or write for full particulars.—The British School of Motoring, 6, Coventry St., Piccadilly Circus, W. [0953]

SHIPPING.

BUYING and Shipping for Colonial motor and cycle importers.—The best service through Lindner and Co., Ltd., Birmingham. Established 1842. [4577]

SITUATIONS WANTED.

CYCLE Mechanic, demobilised, requires situation in London district, army certificate.—L., 34, Bilton St., Barking. [1235]

WANTED, by youth with experience turning, boring, drilling, etc., situation as above with motor cycle or similar firm: South-west England preferred.—Box 3,517, c/o *The Motor Cycle*. [X1110]

GENTLEMAN, discharged, 23, desires position with motor cycle and car business as junior salesman or demonstrator, 7 years' mechanical experience, 4 1/2 years' despatch riding: Liverpool-Manchester districts preferred.—Box 3,492, c/o *The Motor Cycle*. [X0690]

With 2 Clips and
Under-plate, 12/6

Cycle Works,
Newcastle, Lingfield,
Surrey.

Dear Sir,

The Spring Cushion for Pillion Riding which we had just before Easter has been on a long tour to the Midlands and the North, and has given our customer complete satisfaction.

Yours faithfully,

SYDNEY WALLIS.

W. J. BRADLEY, Patentee and Manufacturer,
69, Regent Street, LEAMINGTON SPA.

Enamelling OUTFIT No. 1.

For Motor
Cycle and
Sidecar.

INCLUDES an ample supply of absolutely everything you need to thoroughly renovate a Motor Cycle and Sidecar. Contents: Sponge, Chamois Leather, Rubbing Felt, Pumice Block, Robbialac Brush, Glass Paper, Cleaning Soda, Pumice Powder, Auto-Stopper, "Rusoline" Polishing Liquid, Robbialac Thinners, Robbialac Stopping, Mat, Gloss, Transparent; and Instructions. Price 35/-. Carriage extra England and Wales 1/6, Scotland and Ireland 2/-. Full particulars, including large Colour Card, from Jenson & Nicholson, Ltd., M.C. Outfit Dept., Robbialac Works, Stratford, London, E.15. Sole manufacturers of

SITUATIONS WANTED.

TO Manufacturers.—Capable Gentleman wishes to get into touch with a go-ahead firm of light car or motor cycle builders to manage agencies and travel the British Isles, or would take sole selling rights on contract, 16 years' experience, and has interest in the retail business, with proved organising and controlling abilities.—Box L512, c/o *The Motor Cycle*. [7787]

SITUATIONS VACANT.

EXPERIENCED Chauffeur, London district, capable of attending to running repairs, required for swift commercial light car.—Write, F.P., c/o J. W. Vickers and Co., Ltd., 5, Nicholas Lane, E.C.4. [1290]

OFFERED to Keen Salesman already representing firm of standing in motor trade, two good saleable lines largely advertised and in demand, worked as a side line would show a handsome return; satisfactory terms.—Apply, Box L1,266, c/o *The Motor Cycle*. [1181]

HOTELS AND APARTMENTS.

COLWYN Bay, Rhos.—The Towers, Whitehall Rd., 7 doors from Osley Promenade. Supper, bed, breakfast, garage, 8/6.—Tel.: 233. [6633]

PARTNERSHIPS.

EXPERIENCED Sales Manager desires partner with capital to open motor cycle and motor accessories business, good proposition to one willing to invest; principals only dealt with.—Write in first instance with details, Box L1,267, c/o *The Motor Cycle*. [1182]

ADVERTISER desires active position in motor car and/or motor cycle trade, willing to invest up to £1,000 in a really going concern, remuneration required £400 per annum, age 25, public school education, several years' commercial experience, at present holding a responsible position in a large commercial house in London, but is desirous of getting into the motor trade.—Reply in first instance to B. 189, c/o Deacon's, Leadenhall St., E.C.3. [X0992]

GARAGES.

MOTOR Cyclists Note.—Private garage, use of bench; 2/- weekly.—195, Elgin Terrace, Maiden Vale. [1161]

AGENCIES.

AGENCY Wanted.—Motor cycles, cycles, and accessories. Advertiser opening up new premises main North London road.—Box 3,531, c/o *The Motor Cycle*. [1525]

OVERSEAS Agency.—Member of A.I.F., shortly returning Australia to resume position of business manager, will accept approved agency N.S.W. (other States arranged for if desired) of motor lorries, charabancs, touring cars, motor cycles, motor accessories; one make only accepted; good business references submitted.—H.T., c/o Grundy, Lamb, and Grundy, Solicitors, 14, John Dalton St., Manchester. [X1113]

W. SAUNDERS, Ltd.—This private company was registered on March 12th, 1919, with a capital of £12,000 in £1 share. Objects, to acquire the Red Garage and Motor and Engineering Works of the late W. W. Saunders, 26 and 28, Crouch St., Colchester, one of the oldest established motor businesses in the county of Essex. W. Saunders, Ltd., still have vacancies as agents (sole or otherwise) for high-class cars, light cars, runabouts, and motor cycles.—Tel.: Red Garage, Colchester. Phone: 392. [1178]

GENERAL TRADE.

RELIABLE 2-stroke Engine Units.—Would be pleased to hear from firm interested.—Box 3,530, c/o *The Motor Cycle*. [X0844]

MOTOR Cycle Frames.—Quotation required from frame manufacturers for a large number of cycle frames.—Apply, Meteor Mfg. Co., Ltd., 98, Tollington Park, N.4. [1409]

WANTED, firms who can undertake the manufacture of quantities of small motor cycle gear parts. Must be first-class workmanship and good deliveries: Birmingham or London district.—Write, Box L1,328, c/o *The Motor Cycle*. [1393]

ADDRESSES of Firms making deep drawn stampings, 3-16in. plate, 3in. deep, 2 1/2in. diameter, cups, connecting rod stampings, valves, crankshaft stampings, gear cutting, small turning, cylinder boring, valve fitting.—Box L1,327, c/o *The Motor Cycle*. [1392]

PERSONAL.

L2397—If not claimed will be sold to defray expenses.—Webster's Garage, Folkestone. [1242]

WANTED.

A **SUNBEAMS**, Harleys, A.J.S.'s, Enfields, B.S.A.'s, Nortons, Triumphs, Matchless, and Morgans; 1915's and later purchased for spot cash.—Mandee, 100, Gt. Portland St., London, W.1. [1918]

A **AAA**.

BRING your machine to us before taking it elsewhere. We will buy for spot cash; highest prices given. Lightweight and twin combinations particularly wanted. Ride up with machine, and walk out with cash.—The H.C. Motor Co., 347, Finchley Rd., N.W.3. Phone: Hampstead 4631. Open Saturday afternoons and Sundays. [5669]

The Price of Fuel.

IN last week's issue we announced a belated reduction in the prices of motor fuel, and quoted the figures sent to us by the Shell Marketing Co. It now transpires that the figures were *trade prices*, and that the reduction to the public is only threepence per gallon. There was no such intimation on the postcard advice we received.

Such a small concession can hardly fill any devotee of the motor cycle with glee. Many times we have been told that the exorbitant prices of petrol have been due to Government control, and that when this was relinquished an appreciable reduction in the price of fuel could be confidently expected.

We are not convinced that the present high prices are necessary; but the spirit which was responsible for the statement on the part of an official of the Petrol Trust, that "The value of anything is what it will fetch," still prevails among the petrol kings.

One has only to compare the enormous numbers of motor vehicles used in the U.S.A., where the price of petrol is low, with the size of the British motoring fraternity, to realise the importance of the question of cheap fuel, and the retarding effect high prices are likely to have upon the future expansion of automobilism in this country. Given fuel at the prices ruling before the war, there is no reason to doubt that the United Kingdom will use motor vehicles in the same proportion to its population as the United States.

At present the cost of petrol is placing a limit on long journeys; and, economical as is the type of machine we use, motor cyclists do not ride the distances they would if the price of fuel were more reasonable. In the meantime, motor cyclists and, in fact, motorists generally, are being forced to the conclusion, as we have often pointed out, that it is necessary to be independent of imported fuel, and will continue to use benzole whenever it is obtainable.

Motor Cycle Prices.

WE are often asked by readers if the prices of motor cycles are likely to fall, and we have regretfully to answer that it is most unlikely; in fact, it is more than probable that prices will continue to rise for some time to come.

We all know that the cost of materials is high, and that the cost of labour is ever-increasing. It is not reasonable, therefore, to expect that motor bicycles will become cheaper in the near future.

There seems to be only one solution of the difficulty, and that is, the question of production. Manufacturers who are in a large way are able to turn out a large number of machines, using the latest tools and the latest labour-saving devices, and will be able to sell more cheaply to the public than the small maker whose rate of production is only a comparatively few machines. We see signs in every direction of an unsettled state of affairs in the motor cycle trade. From one day to another the manufacturer does not yet know how much to charge for his new models, and this fact is reflecting very heavily upon the private purchaser.

The manufacturer in his catalogue or preliminary list makes some such statement as "prices are subject to alteration without notice." This is a very hard rule, and it has meant that in many cases a prospective purchaser who has paid his deposit to an agent for the machine he is anxious to buy at, say, £60, receives one morning a letter from the agent, some weeks before the machine is due for delivery, to the effect that the price has been raised £5 or £10. The feelings of the prospective purchaser may be well imagined, and he is more often than not prone to vent his wrath upon the unfortunate agent, who is no way responsible.

Though we fully realise the difficult position of the manufacturer, he should use every effort to give the prospective purchaser fair warning of what is about to take place.

Occasional Comments by "Ixion"

Those Trophies.

A FEW years ago any wealthy sportsman with a habit of distributing massive silver trophies was a popular person in motor cycling clubland. To-day any wideawake secretary gets his doctor to certify that he is suffering from smallpox if he hears that a plutocrat is contemplating such misplaced generosity. Circumstances compelled me to emphasise this *impasse* even in pre-war days, but the difficulty of boiling down an entry of 100 good men on 100 good mounts to one absolute winner is far graver than ever it was. The problem is acute in a one day event of the daylight type. In twenty-four or forty-eight hour rides, darkness strings the men out a little, but not sufficiently to separate the real cracks appreciably. In the Six Days Trials of the future, the superfine quality of the entrants will tend to counterbalance the length of the route, and make it increasingly difficult to allot single awards, such as a special prize for the best performance by an amateur. Secretarial ingenuity is apparently exhausted. Secret checks, speed tests, split-second timing at controls, fuel consumption, flexibility climbs, speed judging, freak hills of the 99% eliminating type, and all other conceivable factors have been introduced. Most of them entail an intolerable amount of work. Most of them allot the special award with no greater fairness than if the names of the gold medal winners were shaken up in a hat, and one were drawn at random. I have accompanied several big trials in which one or more of the special awards were certainly questionable. I believe the sport has reached a stage at which we should choose between eliminating the single victor (*i.e.*, restricting the awards to gold medals for all gaining a certain percentage of marks) or awaiting a brainwave of consummate genius. The factors of selection employed in 1913-1914, and foreshadowed for the minor events of the present season, are the sorriest makeshifts. Such a policy is certainly desirable so far as Saturday events are concerned. [This paragraph was written before the publication of Mr. Norton's letter in our last issue.—Ed.]

Limitation of Entries.

FURTHERMORE, unless I am much mistaken, reforms are no less necessary in regard to the number of competitions and the size of the entries. There is not a word to be said against club members' events, or even against such events being thrown open to amateur riders from neighbouring clubs. But the 1913 type of roundabout is plainly going to be restored. From Easter to Michaelmas, plus a few audacious spasms at Christmas and the New Year, every week-end is to see a host of competitions, large and small; every manufacturer's catalogue and newspaper advertisements will be reduced to smaller and smaller type in order to recount the appalling list of gold medals and fastest times; every ignorant beginner will be increasingly bewildered by the apparently uniform

victories of the best and the worst machines (how can he distinguish between the team prize in the A.C.U. Six Days and the speed-judging competition of the Mudshire M.C.?); every factory will be compelled to waste good men on the weary circuits at legal limit which add another line to the firm's catalogue of medals.

Incidentally, these incessant competitions tend to become injurious all round. They obsess club life and frighten away many desirable members and memberettes. They create in the minds of the general public a maximum impression of speed, noise, and dust. In the bigger trials, the size of the entry is a nuisance to officials, competitors, hotels, and public.

The Remedy.

WE have stagnated for five years, and it goes without saying that we must be allowed to run riot this summer—and perhaps next year as well. But before the season of 1921 at the latest, and preferably during the coming winter, the A.C.U. should take steps to control what threatens to develop into a general nuisance. The remedy is absurdly simple. In the first place, competitions should be classified. A dozen (more or less) events should be hall-marked as first class; for these only should entries be accepted from the trade and from individuals who have won their spurs in minor canterers. If desired, a running score might be kept of all successes in these first-class shows, and at the end of the year the men who deserve most credit would get it. Second-class events would be those of the smaller clubs: trade entries and individual entrants with, say, three golds (exclusive of dates) to their name would be excluded from second-class events, and the novice and the duffer would get a show. Other details could be left to an opportunist policy. For example, fifty entrants are enough for any road event; and that number can be made the limit by a variety of dodges, *e.g.*, setting a stiff entry fee, limiting each make to three representatives, etc.

The Alternative.

AT present we are heading for the kind of Bedlam represented by four big competitions every week-end in one part of the country or another, each with its 100-150 entrants, and some 75% of gold medals. One evil result from the competition rider's own standpoint is already evident—gold medals are as cheap as dirt. There is hardly a solitary motor cycling medal which retains anything like the prestige of the old North Road Cycling Club's "record" golds. Another evil is the fearful waste of time, energy, and money involved. Yet another is the habit evolved by certain firms of swamping poorer rivals by entering their machines in dozens, directly or indirectly. Next year we must prepare for a change. Control of this confusion by a live and democratic A.C.U. will be welcome when the time comes: and we may hope for some rational supervision within two years.

A Big Existing
and Potential
Market in Java.

THE MOTOR CYCLE IN THE EAST INDIES.

900
Motor Cycles
in the Town of
Soerabaya.

OWING to the advantages which the Americans have enjoyed during the war, they have literally turned Java into a market of their own, so far as things motorish are concerned. A glance at the official statistics will give an astonishing idea as to the extent of the growth of the American imports in this part of the world, which development, to a very great measure, is traceable to the big increase of wealth in the island during the war. Now, however, that the war is over, it is most sincerely to be hoped that British manufacturers of motor cycles will make a great effort to find a strong position for their productions in this market. American cars are, of course, everywhere, and perhaps it is not too much to say that American motor cycles are almost as numerous. Indeed, so much progress has been made under almost ideal conditions, that there is scarcely an American machine whose name is not a household word, especially in the bigger towns. The present state of affairs must, I am sure, impress British makers, but even more important is the fact that motor cycling in Java and Sumatra is only in its infancy, and a great boom can surely be expected in the very near future.

This tight little island of Java—to leave out the numerous other Dutch possessions in the Indies—has a population of about thirty millions and no fewer than a million Chinese. The latter own perhaps more wealth, collectively, than any other Oriental race in this country, and practically all the important retailing business is in their hands. Java is generally acknowledged to be one of

the most fertile countries on the face of the earth, and it is no idle boast to claim that it will soon experience such prosperity as it has never known before, its resources of commodities for export being almost unlimited. An increased prosperity means, of course, that all inhabitants, of whatever race or colour, will have more money to spend, and it is principally to this

coming increase in wealth among the Chinese and better class of native that one must look for the development of the pastime of motor cycling, although, as a matter of fact, the motor cycle is daily growing in popularity with the many thousands of Europeans and Eurasians.

Of much interest to the motor cycle world is the fact that petrol, petroleum, suitable lubricating oils, greases, and other by-products are produced in great volume by the Dortsche Petroleum Company on the spot, so that motor users here are more than independent on the outside world for such necessities. Tyres of every known make in Europe and America have been imported in enormous quantities almost without a break for the last four years. The petroleum company has a very excellent system of distribution

at fixed rates, according to the distance of each depot from the supplying centre, and it must be a very small place indeed in which there is not at least one Chinese dealer ready with whatever a touring motorist might require. It has already been reported in *The Motor Cycle* that the roads in Java are very good, and I can testify that this, broadly speaking, is a fact. True enough, in the more inaccessible mountain places surfaces are anything

Motor cyclists in Java do not require overalls but are able to enjoy the pastime in neat attire.

The Motor Cycle in the East Indies.—

but perfect, but in all my travelling, in East Java at least, I have not yet found a road leading to anywhere interesting that could not be ridden by motor bicycle in more or less comfort.

There, in the blue distance, is Tosari, whose sanatorium is renowned all over the East, 6,000 feet above sea level, the approach to which is a magnificent winding climb of about seventeen miles from the plain—truly a joy to any motor cyclist with a moderate amount of power under his control. Nobody who has not experienced this climb and the subsequent descent can

are getting more and more numerous, but the attire of many of them is inclined to be fantastic. They love to ride slowly about town with their exhaust open and clutch only partly engaged; and, as they almost invariably ride Indians or Harleys, they produce what to them is a very delightful noise.

Looking at the map of the world, it is perhaps difficult to realise that this town of Soerabaya—to take one of the principal towns of Java—boasts about 300,000 inhabitants; but such is the fact. Motor cycling locally is very much to the fore, about 900 machines of all makes being registered in the city. The following table will give an idea of the proportion of the various makes in use:

Top:
A road in Java.

Middle:
A motor cyclists' camp on the south coast of the island.

Bottom:
A "freak" hill-climb over the mountains 6,500 feet high. Near Nongkodjadjar.

Harley-Davidson	25%
Indian	20%
Excelsior	10%
Henderson	10%
F.N.	10%
Sunbeam	2½%
Cleveland lightweight	5%
Indian lightweight	5%
Royal Enfield	5%
Miscellaneous	7½%

In this country, where the conditions are so ideal for long tours, the big twin is overwhelmingly popular, and 28in. wheels have become so well established that, if British manufacturers wish to get into the trade here, *they will have to cater* for this feature. It goes almost without saying that the quality and reliability of the British machine is well known amongst serious and understanding motor cyclists in this country, most of whom, by the way, are regular readers of *The Motor Cycle*; but

form the remotest idea of the exhilaration of this run, whilst the changing scenery unfolds as one makes the gradual transition from the great heat of the plains to the extreme cold of this fairyland in the clouds is truly gorgeous.

The main roads, taken as a whole, are splendid; and, with the exception of local towns in which there is generally a polite request suspended from the trees, asking motorists to drive slowly, there is no speed-limit. This freedom of the road has perhaps one drawback, inasmuch as it gives road hogs too much latitude, and their frequent "blinding" through intricate slow traffic has done a good deal to bring motor cyclists into disrepute in the eyes of many Europeans here. On the whole, however, the public and the press are quite sympathetic. It is only when a glaring case of recklessness is reported that some control to be exercised against motorists is asked for. Native riders

The Motor Cycle in the East Indies.—

makers at home will have to fall into line and give what is wanted, which is, of course, something to compete in all respects with the best known American machines. I have unfortunately lost touch with what has developed in the English motor cycling world, so, perhaps, after all, some of my remarks are superfluous. I sincerely hope they are! [Most British Colonial models now have 28in. wheels.—ED.]

Although until recently I have been a rider of an American mount, I am looking forward to the time when I shall be in a position to get an English big twin and sidecar; and you may take it for granted that the handful of my fellow countrymen here, who are very keen and have experience of all kinds of mounts, are at one with me in hoping for the ascend-

ancy of the British bicycle in this wonderful country. It is now for the industry at home to make a strenuous bid for these markets, for it goes without saying that the Americans and their friends will not relinquish their present very strong position without a fight.

It might be arranged that a suitable man be chosen to tour the East from Colombo to Shanghai in the interest of the motor cycle trade in general, and so see for himself the peculiar conditions of each big market; the knowledge and business that would result from such a tour would more than repay the outlay. This is the time for combined effort, and I am sure that in all the big towns of this country, at any rate, there are keen Britishers or pro-British Dutchmen who would only be too glad to help such a representative in his mission.

BANYU BIRU.

During H.M. the King's visit to Sheffield last week, more than usual interest was taken in the "march past" of a Motor Machine Gun Battery. These Clyno outfits did fine work on the Western and other, Fronts being specially mentioned in despatches by Field Marshal Sir Douglas Haig.

An Open Trial Amid Welsh Hills.

Liverpool M.C. to run its Whitsuntide Event on Benzole.

THE first important trial to be run on benzole will be held under the auspices of the Liverpool M.C. on Whit-Monday. It is an example which other clubs might well follow in order to encourage the use of home-produced fuel.

It is anticipated that the trial will attract a good entry, as the course comprises one of the most beautiful tours in North Wales, and the trial finishes early to enable those competitors from other districts than Liverpool to reach home the same night. Many participants in the London-Edinburgh run are expected, and special arrangements are being made to meet the train which leaves Edinburgh at 4.55 p.m. on Saturday and Sunday, arriving in Warrington at 11.11. Here the secretary of the Liverpool Club is arranging for a supply of fuel to be outside the station for the sixteen miles run to Chester, and the garage at the latter place will be open all night. London-Edinburgh

competitors intending to enter the North Wales event should communicate with the secretary, Mr. L. W. Barton, 22, Lord Street, Liverpool.

The trial starts at Hawarden Castle Hotel, Queensferry, at 9 a.m., and embraces Mold, Cilcain, Loggerheads, Ruthin, Cerrig-y-Druoidin, to Bala, where there is a lunch stop of 1½ hours. The return journey is via Pont Newydd Station, Cross Foxes Inn, Dinas Mawddwy, Bwlch-y-Groes, Bala, Llangollen, Old Horseshoe Pass, Llandegla, Coed Talon, Hope, Hawarden, and Queensferry. The total distance is approximately 130 miles. The three non-stop sections are as follows: From Mold via Cilcain to the Loggerheads—about eight miles; from Dinas village to the top of Bwlch-y-Groes—eight miles; and from Llangollen to the top of the Horseshoe Pass—about six miles. First, second, and third class certificates will be awarded. Entries close on Monday next, the 2nd prox.

THE 350 c.c. PRECISION TWO-STROKE.

A New Engine with Mechanical Lubrication, Detachable Head, 74 mm. Bore and 81 mm. Stroke.

The new Precision engine in detail: (Left) Part section across the crank case. Note the double ports in the cylinder for the transfer of gas. (Centre) Part section through the crank case, showing the magneto drive chain with disc on the crankshaft, roller bearings, etc. (Right) The magneto chain is utilised to throw oil into the trough through the lower strainer.

THE new Precision two-stroke engine made its *début* in the Sutton Coldfield Trial for the Levis Cup, and its rider was announced as the winner, but, owing to the fact that he failed to produce the sealed envelope explaining the route, he was disqualified.

This, however, does not lessen the merit of the performance.

The cylinder and detachable head of the 350 c.c. Precision two-stroke.

We were at the Precision works a few days previously and tried the new engine, the development of which we have followed with great interest since the days before the signing of the Armistice, when

it existed only on paper. For its capacity, it impressed us as being remarkably efficient, being capable of attaining and maintaining high speeds without the least sign of over-heating.

Although intended solely as the power unit for a solo machine, for demonstration purposes Messrs. F. E. Baker, Ltd., have fitted the engine in a light sidecar machine, and have obtained speeds higher than those of any of the pre-war sidecar machines we have tried. What is more important, however, is the fact that, after an all-out run with sidecar, the engine was no hotter than is an air-cooled engine of the four-stroke type after it has been running for a short time. This demonstrated that the designers have succeeded in making an advance on pre-war design of the three-port two-stroke engine, and no doubt the lubrication contributes in no small degree to the results obtained.

It may be recalled that we described this lubrication system when reviewing the patent specification some time ago.

The Question of Lubrication.

Among two-stroke designers and users it is generally agreed that the question of lubrication has very great bearing upon the efficiency of this type of engine. Too little lubricant causes the engine to over-heat, and too much upsets the mixture and accounts for the four-stroking of many engines, in which the gas is first compressed in the crank case.

In designing the new Precision engine, Messrs. Baker have aimed at providing a continuous supply of oil to the walls of the cylinder always consistent with the speed of the engine. At the same time it was considered undesirable to embody mechanism of a complicated nature. To

obtain the desired results, the designers first of all placed the magneto behind the engine, and approximately level with the cylinder. The magneto drive is by chain, which is utilised to carry oil from

The connecting rod and crankshaft, showing the roller big end and the method of its retention.

a sump on the side of the crank case to a trough at the top of the chain case. Here the oil is filtered, and flows by gravity via a channel at the rear of the cylinder to

The 350 c.c. Precision Two-stroke.—

two passages communicating with the cylinder at two points opposite each other. The piston has an oil groove, which helps to distribute the oil equally around the cylinder.

It may be imagined that the oil thus thrown up and into the trough by the chain would be in the form of a spray. This is not so, however, but a continuous stream of oil is in circulation, so that the trough is always full. The oil which drips from the cylinder walls on one side is taken through a channel to the compression retaining washers on the flywheel side of the crankshaft, while the balance does what little lubrication is necessary at the roller big end and side bearings. The supply is regulated as required by means of a cone valve adjusted by a knurled screw on a dial.

Incorporated with the magneto driving sprocket in the main shaft is a disc which serves to pick up the oil when the level is below that of the underside of the chain, and on the side of the crank case there is a gauge to show the level of lubricant in the sump. So long as oil is visible at all in this gauge, the disc will circulate it, and sufficient oil can be carried for about 300 miles—the consumption being approximately 1,000 miles per quart.

The oil is not used more than once, hence the presence of the two strainers shown in the illustrations requires some explanation. It will be noted that the magneto chain case, which acts as an oil container, is fitted with a large filler cap held in position by a stirrup and knurled screw. The top strainer is used when the supply of oil is replenished, and is kept in position by a light spring. The lower strainer filters the oil that is thrown up into the trough, and is a safeguard against small particles of metal from the sprocket or chain being taken into the engine.

A Detachable Head Adopted.

As will be seen from the accompanying drawings, the new Precision has a detachable head, which is an innovation in two-stroke engine design. This is secured to the main barrel of the cylinder by four long bolts which screw into the cylinder casting. The head is machined, which probably assists in the general efficiency of the engine, as a machined surface does not carbonise so quickly as one which is rough cast. The compression release which is fitted in the head is a comparatively large mushroom valve and operated by a substantial lever and a strong spring which owing to its exposed position is not likely to lose its tension through overheating.

The cylinder has a bore and stroke of 74 mm. and 81 mm. respectively, the capacity being 349 c.c.

Owing to the extremely narrow connecting rod, possible with a roller bearing big end and the design of the crank throws, the capacity of the crank case is kept low, hence the initial compression is fairly high.

Although this engine may be described as being of the three-port type, there are actually four ports in the cylinder. At the front there are the exhaust and inlet ports, and at the rear two transfer ports. Through one of the latter the mixture from within the piston passes into the

Plan view through cylinder showing the oil channels and the valve for regulating the supply.

transfer passage *via* one of the holes which are drilled in the rear side of the piston to balance it. This assists in cooling the piston.

A Well-designed Piston.

The piston has one ring only, which is of the conventional type with diagonal cut, and is pegged to prevent its turning in its groove. The top of the piston is designed to turn the flow of the incoming gas in a vertical direction in an easy sweep without loss of gas direct to the exhaust port. The accompanying drawing shows the rather unusual shape of the deflector. On the "roof" of the piston there are several webs which increase the area for cooling purposes and permit of light construction.

Phosphor bronze bushes are fitted in the piston bosses, in which the gudgeon pin oscillates. The latter is secured to the small end of the connecting rod—another reversal of usual two-stroke practice, and a feature which provides exceptionally large bearing surface.

As mentioned previously, the "big end" is fitted with a roller bearing. This consists of sixteen rollers retained by two hardened plates, which are riveted on to the connecting rod, the whole being a very neat and light assembly.

Roller bearings are used also to support the main shaft, two rows of rollers on

The new 350 c.c. Precision two-stroke engine.

the flywheel side, and one on the magneto drive side.

On both sides compression retaining washers are fitted, which consist of hardened bushes and slightly dished spring steel washers. In addition, felt washers are inserted between the bushes and the ends of the bearing housings.

Quite an interesting feature of the engine is the method of connecting up the magneto. This probably necessitated more thinking out than any other part of the design. A moment's consideration will show that a constant flow of oil over the magneto sprocket on the one hand, and the necessity to prevent oil reaching the magneto on the other, combined to create a problem difficult of solution, if accessibility and simplicity were to be retained.

Magneto Coupling.

A large boss is provided in the back of the chain case, and in this a long bearing is fitted and provided with ample means of lubrication. The chain sprocket is fitted with a long sleeve which revolves in the bearing, and within the former is another sleeve, having at its outer end a flange containing a taper hole to take the tapered shaft of the magneto. The coupling between the two is by a simple form of dog clutch, and as the two sleeves are not in contact no strain is placed upon the armature shaft, the coupling being self-aligning, as it were.

A screw plug in the outer case gives access to the screw, which secures the magneto shaft to the flanged sleeve; by turning this screw the flange and taper shaft separate, thus facilitating magneto adjustment, while when it is desired to remove the magneto altogether it is only necessary to loosen one nut, which slackens the strap holding the magneto, when the unit may be withdrawn.

Adjustment of the magneto chain is obtained by the sliding plate, which embodies the magneto platform and the bearing for the sprocket sleeve.

The exhaust pipe is of rather unusual shape, and is perhaps better described as two expansion chambers. The vertical portion consists of castings top and bottom connected by a conical tube with the smaller diameter at the bottom. This permits a rapid expansion of the exhaust gases as they leave the cylinder. A second chamber on similar lines is connected at right angles to the lower end of the vertical chamber, the exhaust pipe extension being fitted in the former.

Although no baffles are embodied, the exhaust is not unduly loud, but, should it be found desirable, a baffle could be installed in either of the chambers.

To summarise, the new Precision engine strikes us as being a most interesting power unit to which has been devoted a considerable amount of thought and time. It has been designed as a power unit for a solo machine—a type of motor cycle quite distinct from the lightweight and the average "3½" which has been developed as a dual-purpose mount.

At the present time there are too few machines in this class for the solo rider who requires something more than a 2½ h.p. lightweight and a mount of lighter weight than the dual-purpose "3½," and no doubt there is a future for a 350 c.c. two-stroke of the Precision type if it is built into a frame suitable for its power.

A Commentary based upon Practical Experience and a Study of Overseas Opinions.

Paving the Way.

OVER six months have elapsed since the first Armistice, and each week that slips by more and more accentuates the difficult position in which the British makers of motor cycles find themselves. High prices of materials and labour difficulties, together with a scarcity of many of the vital essentials, combine to retard and restrict output, with the obvious result that those of their foreign competitors, who have not so suffered from the effects of the lengthy period of disorganisation and diversion from their ordinary business routine, are taking steps to secure Overseas trade by establishing business centres and organisations in likely countries. The temporary expedient of restricted imports and a tariff have eased the internal situation somewhat, from the makers' point of view, but pity the poor rider!

Although the action of the Swedish Government in placing a temporary embargo on further imports of American machines into that country is indicative of the great activity now proceeding, the immediate establishment by the United States of central business bureaux will give them a precedence that will not be easily regained by the British manufacturers, who have still a long way to go before they get their own house in order.

The first important step has been taken by this country in the despatching of a trade commissioner to study the trade conditions in all parts of the world; and, by the time his reports are complete, the motor cycle industry here will most probably be ready to cope with the Overseas demands. In the meantime, the greatest energy is necessary to prepare the way for trade in previously untapped areas by the establishment of permanent commissioners appointed by the representative body of the trade as a whole.

Brakes.

THE question of brakes is a very important one to all motor cyclists, but perhaps even more important to the Overseas rider than to the man at home. Obviously it is best from a theoretical point of view that all wheels should be braked, as this gives the greatest possible retarding effects, and, moreover, does not throw all the work on one wheel and tyre. In practice there are difficulties in the way of this highly desirable consummation, but only those difficulties which, in our opinion, can be overcome when proper attention is given to the subject. We recently touched upon some of the pitfalls which lie in wait for the designer of a sidecar brake. It is very necessary that if a sidecar brake be fitted it should be so arranged that it is impossible to

apply a greater retarding force to the sidecar wheel than to the wheels of the motor cycle to which it is attached. A sidecar brake, then, should be compensated and connected to the rear wheel brake in such a manner that it is applied with greater force to the bicycle wheel than to the wheel of the sidecar. If the reverse were the case the drag of the sidecar might pull the whole outfit round, and disaster might follow.

At the present time motor cycle front wheel brakes have a bad reputation generally, though it must be admitted that there are several good examples to be seen on the road. This has come about from the too slavish copying of cycle practice. What is good enough for a cycle may be inadequate in the case of a motor cycle on account of its greater weight and speed. The problem is not, however, impossible of solution. That a rider should habitually ignore his front brake, or worse still remove it, is a reflection upon the ability of the motor cycle designer, just as to fit two brakes to a rear wheel (a too common practice) is tantamount to a confession of incapacity to design a satisfactory front brake. Some firms are, we know, giving consideration to this important detail, but we fear that others are not, and therefore we have not yet seen the last of the front brake upon the tyre rim, which makes its presence felt most acutely when it becomes necessary to remove the front wheel for tyre repairs.

Wanted, a Smaller and Lighter Colonial Model.

ANYONE examining the modern Colonial model motor cycle must be left with an impression that manufacturers apparently consider all Overseas buyers are tall riders. With the increased ground clearances and larger wheels, which are now features of most new models, the saddle height has increased also; and, although the majority of these machines will be found quite as suitable for solo riding as the foreign-built machines which have been developed by the solo rider's needs, design in the larger class has not reached that stage when the comparatively short rider can sit astride a big twin with his feet comfortably on the ground.

This, of course, applies to all riders, at home and abroad, but it is a question which affects the Overseas buyer more because big twins are more often used abroad as solo mounts. Hence there appears to be a vacancy to be filled in the field of motor cycles by a machine designed exclusively for the short-legged motor cyclist, which would be lighter than, but still as powerful as, the modern big twin.

A New Hudson sidecar outfit on the coast road near Capetown. In this district the roads are good, and motor cycles are now seen in greatly increasing numbers.

A Selection of Letters from Readers scattered all over the World.

Motor Cycles for the Argentine.

"BRITISHER," writing from Buenos Ayres, emphasises the possibilities for the British-made machines and sidecars in South America.

"Having been a keen motor cyclist for some years I am deeply interested in the manufacture and sale of machines. The Argentine at present is almost entirely supplied by the United States. There is a wonderful field open here for the British manufacturer in this line alone, provided he is far-seeing enough to produce a machine the country requires, and is prepared to compete with the American firms; if not, the Yankees, with their usual enterprise, will have all the trade. There is also a very good opening for strong coachbuilt sidecars, as the sidecar combination seems to be getting very popular in these parts. I think the single-cylinder machines, like the Sunbeam, P. and M., etc., would do very well here, but I do not recommend belt-driven machines for this country. Also, machines like the Matchless and A.J.S. would do well here for sidecar work. I do hope our manufacturers will make a big effort now, and before it is too late, otherwise the Americans will, I fear, have all the trade."

An Ideal Specification for India.

An ideal specification for India is given by MR. J. W. BENNETT of the Indian Police:

"As an interested reader of your journal and a motor cyclist of some experience in India, I feel justified in making a few remarks regarding the kind of motor cycle required for Colonial use, especially at such a time as this when 'Reconstruction' is thrust so prominently before our eyes.

"During the last five years I have owned no fewer than five different machines of English make, viz., a $3\frac{1}{2}$ h.p. single-speed Triumph, a 3 h.p. twin two-speed Royal Enfield, a $3\frac{1}{2}$ h.p. three-speed countershaft Rover, a $3\frac{1}{2}$ h.p. single-speed New Hudson, and a $3\frac{1}{2}$ h.p. twin hub three-speed Matchless.

"Now, on an English road, or on an Indian road, which can stand comparison with the former, all these machines are excellent. But good roads are the exception, and not the rule, in India; so our motor cycle must be built to stand good and bad alike, and on bad roads we must have something sprung front and rear. (For that matter, all machines

should be of this type, whatever road it is intended to traverse.) I do not profess to be an authority on springing; that is left to the manufacturers. But the springs must be prepared to stand plenty of strain, and at the same time have lots of flexibility.

"Our next consideration is lack of bridges. We must just take a water-splash in our stride. Now, a belt or chain-cum-belt drive is all right up to a limit, and it is reached when it comes to a case of water. It is essential to have either an enclosed chain drive or shaft drive. Moreover, both in the case of water and bumpy roads we must have high crank case clearance. The English motor cycle has the same fault as the English motor car, so far as Colonial use is concerned—there is not enough ground clearance. We also want the magneto perched high on the frame to prevent the admission of water.

"Now, to consider loose and hilly surfaces. Large wheels and tyres (28in. x 3in.) are essential, as they tend to prevent skidding. I am glad to see that hub gears have died a natural death. So give us a really good three-speed countershaft gear and clutch. The clutch should be foot operated. I am not in favour of hand-controlled clutches. Bowden wires are all right in their way, but they can make themselves very disagreeable at times, especially when they snap somewhere in the middle.

"It is seldom an average speed of 20 m.p.h. is attained for a long stretch. The usual performance is far short of that. Bumpy roads, pot-hole roads, and bullock carts and cattle which refuse to move out of the way, prevent a good average. Hence, the amount of 'tap twiddling' necessary is enormous; nay, more, it is highly inconvenient. When the road persists in jerking you off the saddle into mid-air you want all your ten fingers to grasp the handle-bars the more tightly. In my opinion, the American system of grip control is superior to our method.

"It is a well-known fact that no motor cycle has yet been equipped with a really efficient mudguarding system. Well, most of us are fairly used to getting a bit splashed, and by means of weird and wonderful disguises manage to keep the inner layer of clothes fairly clean. So let that pass for the time being. My argument is that there should be more clearance between the tyre and the mudguard. More than

Overseas Sect.on.—

once—many times, in fact—when travelling over a road where the mud is specially glutinous, I have been absolutely stopped dead because the mud, having filled the space between the tyre and the mudguard, had completely jammed both wheels. And how difficult it was to scrape out the mud when the clearance is only one inch! This also points, I think, to the moral that both front and back mudguards should be very easy of removal—off with a few nuts, and both should be free to be taken out without further trouble.

"In India garages do *not* abound. Except in the big towns, such as we hear about in the geography books at school, they are an unknown quantity. So when we go out for a run of, say, 150 miles, we must prepare for the worst, and carry every spanner, spare part, belt (or chain), inner and outer tubes, puncture outfit, etc.—in fact, anything we may want *en route*. Now, sir, how is it possible to carry all these articles in the average motor cycle toolbag? To waste no words, it is an utter impossibility. We cannot—in fact, do not—rely on the stock-in-trade of a passing motor cyclist to supply our wants in case of a breakdown, for we know that in all our journeys we shall never—or very, very seldom—see such a phenomenon. So our requirement is a really capacious toolbag—two, if you like, so long as they accommodate all the necessary jimjams. And they should be fitted to the side of the carrier. We want the top to carry our tiffin basket. There are no inns, hotels, or half-way houses out here—in fact, no means of procuring anything except milk and bananas. So we must just carry a small meal, with a minimum of crockery and cutlery. We must have a large tank, capable of holding at least two gallons of petrol and half a gallon of oil, roomy and comfortably inclined footboards, a large saddle, with, I think, a respectable back rest, something on which to lean without getting a pain in the small of the back, and efficient lubricating system, more or less foolproof, so that there is no fear either of caking one's plug with oil or causing the engine to seize, which requires no attention beyond a periodical filling with oil and the turning of a tap, which allows a sufficient quantity to oil all bearings, and no more."

Tropical Conditions.

Mr. G. W. NOTLEY, of Neboda, Ceylon, gives a reminder to magneto manufacturers and all who cater for motor cycle trade in the hot countries. He says:

"I have been very interested in the articles on drives and positions of magnetos—especially the latter.

"Several of the designers seem to have completely forgotten the conditions of the tropics. A very common trouble out here with magnetos is for the shellac (or whatever the insulating substance is) to run out when the whole power unit has become heated after a long climb or long run, and when the magneto has cooled down the armature becomes solid with the magnets. There is one type of magneto which does not suffer from this trouble, but is often known to lose

its magnetism. Cars are troubled in this way as well as motor cycles. Of course, it is essential that the magneto be protected from the wet as far as possible, as tropical rains are noted for the way they come down in 'bucketfuls.'

"When are British makers going to send out some of their machines? The only British bicycle on the market at present seems to be the B.S.A., which, by the way, does remarkably well, and stands an enormous lot of knocking about. American machines are very popular, or, at any rate, are very much in use, because they seem to be the only high powered outfits obtainable at present. I am longing to see British machines take their proper places in Ceylon.

"I have noticed Rev. Walmsley's remarks from time to time on twist controls and the danger of levers. I have found the latter very satisfactory and prefer them to the American controls any day. I might add that I have used both, but suppose we all like the controls we are used to."

A British Single in Canada.

Replying to a letter from Canada in our issue of March 27th, Mr. W. GREENWOOD, of the Tangent Cycle Co., Toronto, points out that the $3\frac{1}{2}$ h.p. Triumph is quite equal to the abnormal conditions with which it has to contend in that country: "I cannot pass over Mr. Warne's letter in your issue of March 27th without comment. The machine mentioned is one I used in 1914. Having the cylinder plated is a doubtful improvement. As he removed the pedals and chain, and attached another pair of footrests, some difficulty must have arisen when he had to start the engine, in a foot of sand, against a strong wind. Drilling a hole near the base of the crank case is another brilliant idea. What makes the idea more amusing is that the Triumph Co. had a similar arrangement in their 1913 models, the result being that after the machines had been run a few hundred miles the big end bushes were ruined by the sand that got into the bearings; and the Triumph Co. sent us a number of connecting rods and bushes to replace the ruined ones, and also some brass plugs to stop up the holes in the tubes. Perhaps Mr. Warne got his idea from the Triumph, and simply removed the brass plug from the tube.

"Packing waste *inside* the valve springs is novel, and 125 miles to a gallon of petrol is very good; I could only get 90 miles. Perhaps he should have said a *thankful*.

"Now Mr. Warne says 8 h.p. is required for serious touring, but I must call his attention to the fact that the Triumph 1912 clutch model holds the record around Lake Simcoe, Toronto and return—181 miles. The writer was in the sidecar on the record run. The time was 11 $\frac{1}{2}$ h., including all stoppages—one of $\frac{1}{2}$ h. at Barrie for lunch, another at Bond Lake of 40m. for broken head lug and front wheel axle. The road from Toronto has a rise of 1,200 feet to Bond Lake, then a drop of 500 feet to Sutton, fifty-five miles from Toronto. This distance was done in 2h. 40m., over rough roads. This road has since been improved with a Tarmac surface. Why should 8 h.p. be necessary when a clutch model $3\frac{1}{2}$ h.p. is enough for a trip like this?"

A Matchless sidecar in a picturesque Hereford village. On motoring past these old-world cottages the inevitable remark on their quaintness is always forthcoming, but their internal arrangements are, in the majority of cases, none too impressive.

SCOOTER DEVELOPMENTS.

THE Motor Cycle policy in regard to scooters is well known. We have openly stated our conviction that it will eventually develop into a miniature motor bicycle—the genuine lightweight we have sought for years past. Our query, oft repeated, “Why stand?” has remained unanswered. Surely the person who would prefer to stand on a motor-propelled platform when he or she might well adopt a comfortably seated position and progress at comparative leisure is a rarity. We have made these remarks before, since the answer to our simple question admitted of but one answer. Apart from this, we welcomed the advent of the original motor scooters, since it was clear that they would perform important missionary work by attracting to the ranks push cyclists who have hitherto regarded motor cycles as too heavy.

The natural development which we foresaw and forecasted in these columns is happening. The scooter we are about to describe can more correctly be described as a miniature motor bicycle—the genuine lightweight, in fact. It has a pan seat, an open frame permitting a coat or mackintosh to be worn by the rider, petrol capacity to give it a range of action far beyond that of the original toy scooters, and its road performances more nearly approach the lightweight motor cycle, though obviously, in the absence of a change speed gear—which may or may not represent a possibility of the future—its hill-climbing or, alternatively, its speed capabilities, are limited by the gear ratio adopted.

For some time past a considerable amount of experimental work has been carried out in the evolution of a practicable scooter by Messrs. A.B.C. Motors, Ltd., which has now reached fruition, and the new design should be ready for sale in about a month's time. Viewed through the eyes of the average motor cyclist, the A.B.C. (properly known as the A.B.C. “Skootamota”) is an extraordinarily diminutive and compact bicycle, yet directly one takes the saddle and assumes control of the machine an impression is immediately evident that it is built for ease of handling and the utmost simplicity of control.

As seen in the illustrations, the frame is of the open type, and

The Latest A.B.C. “Skootamota” provided with a Pan Seat, and now forming a Step between the Scooter Proper and the Lightweight Motor Cycle.

An idea of the size of the A.B.C. “Skootamota” is conveyed by the photograph shown above. Incidentally, it confirms our contentions that the scooter is the ultra lightweight in embryo, for it embodies nothing which is not more or less motor cycle practice.

built up of light steel tubing with welded joints, and, owing to the fact that the centre portion of the frame is dropped to a very low point, it has been possible to provide a large open space in the centre of the machine so that any tangling of dress in the case of lady riders is entirely avoided, whilst at the same time there is plenty of foot room. The frame is built up of four longitudinal tubes attached at the front to the steering head and to the triangular framework at the rear of the machine, which is built over the rear wheel and supports the power unit and pillar for the pan seat. In the centre of the frame of the scooter are three

held to the crank case by four nuts.

A single-throw crankshaft with one web and balance weight is mounted in ball bearings inside the miniature crank case, and the big end provided with a roller type bearing. The piston is of cast iron, having two rings of the same material above the gudgeon pin. On the opposite side to the cylinder a small C.A.V. magneto is secured to the crank case by means of a clamp and long bolt, and is driven by a train of gear wheels from the crankshaft in a housing cast at the side of the crank chamber. The camshaft for operating the valves is mounted in ball bearings above the

crankshaft as shown in the sketch, and also carries a sprocket by which the drive is taken to the rear wheel with an enclosed $\frac{1}{2}$ in. \times $\frac{3}{8}$ in. roller chain, the gear ratio being 10 to 1. A small steel flywheel is keyed on the outer end of the crankshaft outside the crank case, and is also enclosed. A little single-lever automatic carburettor is fitted to the engine in an open and accessible position, and is supplied with petrol from a small tank mounted on brackets above the crank case, the feed of petrol being by gravity. Inside the tank there is a separate compartment for lubricating oil; a hand pump is fitted in this compartment by which lubricant is forced through a pipe directly to the crank case as occasion requires. The exhaust gases are taken through a short length of piping

The complete power unit of the A.B.C. scooter, showing the neat arrangement of the magneto and combined petrol and oil tank above the crank chamber. An important item is that the cylinder head complete with inlet and exhaust valve assembly is detachable from the cylinder for overhauling purposes.

shallow X-shaped cross members made of light steel tubing, which stiffen the middle section of the framework and give additional stability in the main frame assembly.

The Power Unit.

The engine has a single horizontal cylinder with a bore of 60 mm. and stroke of 44 mm. (125 c.c. capacity), and, although only rated at $1\frac{1}{2}$ h.p., the engine is easily capable of giving $2\frac{1}{2}$ h.p. under normal conditions. The cylinder head is detachable complete with the valves, which are mounted opposite to each other in the cylinder head casting, the exhaust valve being overhead for cooling purposes.

Following A.B.C. practice, the cylinder is made of steel and turned from the solid, a flange being provided at the base so that the cylinder can be

Scooter Developments.—

The frame of the A.B.C. scooter stripped to show arrangement of tubular members.

to a small silencer mounted just above the tail of the rear mudguard.

Bicycle Parts.

The steering head and front forks of this little machine follow ordinary bicycle practice in construction, with the exception that the forks themselves are very short in length, while the 16in. wire wheels are shod with 2 $\frac{3}{4}$ in. tyres. Two contracting band brakes are fitted as standard, the rear brake being operated by a pedal in the front part of the foot-board, whilst that in front is controlled by a grip lever on the right handle-bar. In order to give additional comfort a special pan saddle of extra width is employed, and rubber shock absorbers are fitted under the footboard on the main frame. There are also rubber supports at the front end of the board.

General Utility.

In taking a trial run with this miniature motor bicycle (for in effect it is no other) we were pleased with the manner in which the machine could be used and controlled. It should make a distinct appeal for short journeys and general town runabout purposes, where constant stopping and starting are necessary. We found the machine comfortable to ride and able to ascend the moderate hills in the locality in which our test was made with no signs of overheating. Owing to the small overall dimensions it is possible to ride the machine through narrow spaces in comfort at three miles per hour where it would be unsafe to pilot an ordinary motor bicycle, and a great

point in its favour is that it requires little effort to start while in the saddle, merely a single push of the foot being necessary.

Rear of the A.B.C. "Skootamota." It will be noticed that our query, "Why stand?" is answered in Mr. G. Bradshaw's design.

The single web balanced crankshaft of the A.B.C. scooter power unit with roller bearing in connecting-rod big end. The transmission of the

rear wheel is taken through the timing-gear wheels to a chain sprocket on the camshaft.

The ease of control, in conjunction with its open frame, low weight and build, suggests possible developments for this type of machine for messenger service and parcels delivery.

This, the newest of the many A.B.C. productions, can also be used with success in journeys of some length, such as from outlying farms into neighbouring towns, largely for the reason that the rider is seated on a comfortable pan saddle instead of remaining in the standing position; it is suitable for narrow lanes, it climbs hills comfortably, and the petrol tank will hold sufficient fuel for a run of fifty miles.

A Comprehensive Equipment.

It is possible to traverse a circle of 9ft. diameter with ease, while the engine is throttled down, and since the maximum speed of this scooter is about twenty miles an hour it is possible to accomplish ten miles an hour with reasonable comfort for journeys of moderate length. As the machine only weighs 60 lb., and is compact and easy to handle, an attractive point is that it can be stored away in any handy place in a house or shed, and is ready for use at a moment's notice.

The price of this smallest of all motor cycles, known as the A.B.C. "Skootamota," is £40, which covers the registration fee, and equipment comprising horn, tools, number-plates, electric head and tail lamps with battery. The sole rights of manufacture and distribution are held by Messrs. Gilbert Campling, Ltd., 1, Albemarle Street, Piccadilly, London, W.1.

ANOTHER SCOOTER—"THE MOBILE PUP," WITH AN ENGINE HAVING OVERHEAD VALVES.

WHETHER the scooter secures a permanent place in the world of automobiles or not, there is no doubt about the interest displayed by the public and the readiness of manufacturers to meet what promises to be a brisk immediate demand. Already there are at least three propositions on the market and being advertised, and several other embryo designs are being experimented with by private designers and by firms genuinely interested in the new type of vehicle.

The latest addition to the ranks of scooter manufacturers is Mr. E. O. Stafford, who will shortly introduce the Mobile Pup, the design of which, it is

claimed, is based upon actual road experience.

A small four-stroke engine, with mechanically-operated overhead valves and detachable head, is to provide the power. The cylinder has a bore of 55 mm. and 60 mm. stroke, the capacity being 142 c.c. A flywheel type magneto will provide both ignition and lighting current, and a single lever carburettor is among its other features.

No clutch is fitted, as the designers consider such a fitment is dangerous with this type of vehicle. The drive is through a shock absorber through gears to the front wheel, the gear ratio being 5 $\frac{1}{2}$ to 1. With 18x2 $\frac{1}{4}$ in. Palmer cord tyres, it

cannot be said that this new scooter is under-shod. Steel disc wheels are fitted.

The control is by twist grip and exhaust valve lifter, and to facilitate storage the steering column folds after the manner of the Auto-ped. Brakes of the internal expanding type and deeply valanced mudguards are included in the specification. The standard finish is grey.

We understand deliveries are to commence in six weeks' time, and that the price for the first five hundred machines is to be £25 each. We hope to avail ourselves of an offer to test the scooter in a short time, when further details of its mechanism will be given in *The Motor Cycle*.

**North Cheshire M.C.C.**

Members, ex-members, and other motor cyclists in the Wilmslow district, who are interested in reviving the above club should communicate with Capt. J. Oliver, at "Netherfield," Wilmslow.

Northamptonshire M.C.C.

The above club intends holding an open hill-climb at Doddington Hill, near Earls Barton, Northamptonshire, to-day (May 29th). There will be three prizes in each event. Hon. sec., Mr. J. B. Sneath, 3, York Road, Northampton.

Streatham and District M.C.C.

A members' speed-judging competition will be held on Saturday next, the 31st, when two classes will be run if sufficient entries are received: (a) Motor cycles (including sidacar combinations); (b) cars (including cycle cars). Members start from the Clayton Arms, Godstone, at 3.30.

Newcastle and District M.C.

A week-end run to the Lake District for the Whitsuntide holidays is being promoted by the Newcastle and District Motor Club. Members and friends will assemble at the Herd's House, North Terrace, at 2 p.m. on the Saturday, and will reassemble at the Queen's Hotel, Keswick, at 7 p.m. The hon. sec., Mr. W. R. Lister, 2, St. Nicholas Buildings, Newcastle, will be glad to arrange hotel accommodation for anyone desiring to participate. It is proposed to return from Keswick after luncheon on Whit-Monday.

Woolwich, Plumstead, and District M.C.

Arrangements have been made for an inter-club picnic run by members of the Woolwich, Plumstead and District Motor Club, the Streatham and District Motor Club, and the Rochester, Chatham and District Motor Club. The meet will take place at the Rose and Crown, Green Street Green, Orpington, Kent, on Sunday, June 29th, at eleven o'clock. The run will be a tour of the Kentish hills. The picnic will take place on the top of one of the hills about half-way through the run. Clubs interested in inter-club runs, or who intend to take part in the S.E. Counties inter-team trial on August 16th over a sixty-mile course in Kent, will be welcomed.

Further particulars of the picnic and trial may be obtained from the hon. sec. of the Woolwich Club, Mr. F. J. Ellis, 3, Nightingale Place, Woolwich, S.E.18.

Result of the Woolwich Club's recent team trial to Hastings and back: Gold medal winners—O. Breen (Matchless), Petersen (Metz), G. Sims (Douglas), T. Ross (Triumph), Miss Gray (Matchless), W. Whitaker (car), and F. J. Ellis (Matchless).

Future Events.

MAY 29.—NORTHAMPTONSHIRE M.C.C. OPEN HILL-CLIMB.
May 29.—Taunton and District M.C.C. Opening Run to Sidmouth.
MAY 31.—BIRMINGHAM M.C.C. RELIABILITY TRIAL.
May 31.—Finsbury Park C. and M.C. Re-union and Garden Party.
May 31.—N.M.C.F.U., Sheffield. Run to Edwinstowe.
May 31.—Middlesbrough and District M.C.C. Hill-climb.
May 31.—Streatham and District M.C.C. Speed Judging Competition.
May 31.—Wolverhampton M.C.C. Week-end Run to Llangollen.
JUNE 1.—HARROGATE AND DISTRICT M.C. RELIABILITY TRIAL.
June 1.—Carlisle C. and M.C.C. Run to Newland's Corner.
June 1.—Halifax M.C.C. Run to Kirkby Lonsdale.
June 1.—Essex M.C.C. Picnic Run to Maldon.
June 1.—Rochester, Chatham, and District M.C. Run to Hawkhurst.
June 1.—Oldham and District M.C. Run to White-well.
June 3.—Oldham and District M.C. Hill-climb.
June 4.—Middlesbrough and District M.C.C. Run to Durham.
June 6.—Essex Motor Club. Midnight Ride to Yarmouth.
JUNE 6-7.—M.C.C. LONDON-EDINBURGH RUN.
June 7.—Woolwich, Plumstead, and District M.C. Run to Green Street Green.
JUNE 7-9.—BIRMINGHAM M.C.C. TRIAL TO LAND'S END.
June 8.—Woolwich, Plumstead, and District M.C. Run to Charing.
JUNE 9.—COCK AND DISTRICT M.C.C. TWENTY-FOUR HOUR RELIABILITY TRIAL.
JUNE 9.—LIVERPOOL M.C. OPEN RELIABILITY TRIAL.
June 9.—Manchester M.C. Gymkhana.
June 11.—Wolverhampton M.C.C. Run to Wellington Wrekin.
June 15.—Essex M.C. Run to Southend.
June 15.—North Derbyshire M.C.C. Run to Ashbourne.
JUNE 21.—JUNIOR CAR CLUB. HILL-CLIMB AT SOUTH HARTING.
June 21.—Oldham and District M.C. Hill-climb.
June 21.—Woolwich, Plumstead, and District M.C. Run to Maidstone.
June 22.—Birmingham M.C.C. Picnic Tour.
June 22.—Essex M.C. Run to Harlow.
June 22.—Manchester M.C. Inter-club Run with Liverpool M.C.
June 22.—Wolverhampton M.C.C. Run to Rudyard Lake, Derbyshire.
JUNE 25.—ESSEX MOTOR CLUB. SPEED TRIALS AT SOUTHEAST.
June 25.—Birmingham M.C.C. Speed Trials.
JUNE 28.—LIVERPOOL M.C. TWENTY-FOUR HOUR TRIAL TO EDINBURGH.
JUNE 28.—MIDLAND C. AND A.C. RELIABILITY TRIAL.
June 29.—Essex M.C. Run to Dunstable Downs.
June 29.—North Derbyshire M.C.C. Run to Derwent Valley.
June 29.—Wolverhampton M.C.C. (Ladies' Day). Run to Gourd Lodge Inn.
JULY 1 AND 2.—ARETHNOT TROPHY TWO DAYS TRIAL. PLYMOUTH DISTRICT.
JULY 5.—WOLVERHAMPTON M.C.C. OPEN TRIAL.
JULY 6.—OLDHAM AND DISTRICT M.C. RELIABILITY TRIAL.
JULY 12.—LIVERPOOL M.C. RACES AT COLWYN BAY.
JULY 12.—BIRMINGHAM M.C.C. MIDLAND AUG. 16.—S.E. COUNTIES INTER-TEAM TRIAL.
SEPT. 15.—A.C.U. SIX DAYS RELIABILITY TRIALS.

A Maidenhead M.C.C.?

An attempt is being made to start a motor cycle club in Maidenhead and the surrounding district. All motor cyclists who are interested are requested to communicate with Capt. J. V. Hey, Coruisk, Cookham, Berks.

Macclesfield and District M.C.

The opening run of the above club will take place on Sunday, June 1st, starting from the club's headquarters, the Spread Eagle Hotel, Chestergate, Macclesfield, at 2 p.m. Members and non-members are cordially invited. The run is to Peover, where a picnic will be held.

Sutton Coldfield and Mid-Warwickshire A.C.

H. Greaves (Calthorpe - Precision), announced as winner of the Levis Cup, was disqualified for non-production of sealed envelope at the finish, and the amended results of the trial are as follows: (1.) A. Milner (2½ h.p. Diamond), time error 1m. 15½s., Levis cup and gold medal; (2.) Seymour Smith (2½ h.p. Ivy), 2m. 28½s., club gold medal; (3.) Rex Mundy (8 h.p. Matchless sc.), 3m. 1½s., club silver medal.

Bristol M.C.C.

Many entries have been already received for the Whitsuntide tour-trial, Land's End and back. Entries will be received up to the first post on June 5th if sent to Mr. H. Smith, 6, Brynland Avenue, Bishopston, Bristol. Accommodation has been reserved for a limited number at the Land's End Hotel.

West Kent M.C.

At a general meeting of the Blackheath and District Motor Club, held recently, it was decided that in future the club will be known as the West Kent Motor Club. Arrangements are being made for the headquarters to be situated in Bromley, and an early commencement of the club's activities is anticipated. With this in view, a further meeting will be held to-night (Thursday, the 29th), at 8.30, at the White Hart Hotel, Bromley, Kent. All motorists interested are invited to attend.

Finsbury Park C. and M.C.

A reunion and garden party will be held on Saturday of this week (the 31st) at the residence of Mr. E. Allen (vice-president), "Mount View," Little Heath, Potters Bar. Tea will be served at 5 p.m. Past, present, and prospective members are cordially invited. Tickets 1s. each from the hon. sec., Mr. J. Evans, 33, Springdale Road, N.16.

Halifax M.C.C.

This club has been revived, and weekly runs are being arranged to which all local motor cyclists are invited. This year the activities of the club will probably be confined to social runs, but several competitions are suggested for 1920. The subscription is 5s., and arrangements are pending by which it may be possible for the club to use the Clare Hall, Y.M.C.A., as headquarters.

Times to Light Lamps.

SUMMER TIME.

May 29th	...	9.31 p.m.
" 31st	...	9.33 "
June 2nd	...	9.36 "
" 4th	...	9.38 "

High Prices in France.

At a recent sale of Army motor cycles in France the prices of the new 4 h.p. Triumphs on sale varied between £120 and £140.

Police Trap.

We are informed that a police trap, in which motorists are timed both ways over one mile, is working on the London side of Maidstone. The distance is unusual, as police traps in the Metropolitan area are usually over a furlong.

Another Ford Rumour.

It appears that a large aerodrome in County Antrim, which has been occupied by the R.A.F., has been purchased by Henry Ford, and on this it is stated that a huge works will be established for the making of motor cycles to be sold at £10 each.

Costly Railway Travel.

A railway expert has stated that at least two years must elapse before British railways can be restored to their normal carrying powers, and that there is no hope of the fares being reduced for a considerable time. Owners of motor cycles can regard this news with more equanimity than most people. Those, however, who are awaiting delivery of new machines will grow more anxious as the holiday time approaches; especially as manufacturers are behind in their deliveries.

Southend Race Meeting.

By permission of the Corporation of Southend-on-Sea the Essex Motor Club will hold an open race meeting on the Western Esplanade, Westcliff-on-Sea, on Wednesday, June 25th.

The various events will include classes for cars and motor cycles of all types and sizes, and given fine weather a very interesting meeting should result. It is expected that a great number of manufacturers will enter their new models, of which, in a number of cases, this will be the first public appearance.

Entry forms and full particulars may be obtained upon application to the hon. organising secretary, Mr. Harold Fuller, 51, Pulteney Road, South Woodford, Essex E.18.

London-Edinburgh Run—the Timekeeper at the Start.

We greatly regret to learn of the sudden and serious illness of Mr. A. G. Reynolds, who was to have started the competitors from Highgate. Mr. Reynolds has had to undergo a serious operation, and we learn that he is progressing as satisfactorily as can be expected.

His place as timekeeper at the start will be taken by Mr. A. V. Ebbelwhite.

Motor Cycles for the Post Office.

The Treasury has sanctioned the purchase by the G.P.O. of 500 motor bicycles for the carrying of mails. The experiment will be confined to London at first.

Motor cycles have been used by the U.S. Post Office for many years, and we do not doubt that their use in England will be most successful.

It is wonderful how slow the Government have been in realising the value of motor cycles until the war forced it upon their notice. For years the American police have employed them, while the only interest the British police force have taken in motor cycles has been the trapping of their riders.

Petrol Prices.

Last week we published what purported to be the revised prices of petrol. The information then held by *The Motor Cycle* concerning the imminent drop in the cost led us to believe the prices to the public would be approximately as stated on the postcard which we reproduce. They appeared to be reasonable retail prices, and we accepted them as such. Unfortunately for motor cyclists, the Shell Co.'s information advice referred to wholesale prices, although there was nothing to indicate this on the postcard. Instead of the prices retail being 2s. 8d., 2s. 6d., 2s. 6d., and 2s. 4d., they are 3s. 1½d., 2s. 11½d., 2s. 11½d., and 2s. 8d. for Shell, Flag, Crown, and benzole respectively.

"SHELL" MARKETING COMPANY, LIMITED.

19 MAY 1919 1919

We beg to advise you of ALTERATION in prices of our Brands of Motor Spirit

Prices are now as follows—

"SHELL" MOTOR SPIRIT	2/8	PER GALL.
"SHELL" MOTOR SPIRIT	2/6	PER GALL.
"SHELL" MOTOR FUEL	2/6	PER GALL.
"CROWN" MOTOR SPIRIT	2/6	PER GALL.
"BENZOL" SPIRIT	2/8	PER GALL.

Special Features.

SCOOTER DEVELOPMENTS.

THE MOTOR CYCLE IN THE EAST INDIES.

OVERSEAS SECTION.

Detroit's Export Output.

During 1918 Detroit, U.S.A., supplied 8,550 cars to Canada, 2,700 to Japan, 3,830 to Australia, 3,360 to France, and 2,090 to the United Kingdom.

An Outing for Crippled Children.

London motor cyclists who have sidecar outfits are appealed to by the Cripples' Mission of the Shaftesbury Society and Ragged School Union, Bethnal Green Branch, 32, St. John Street, Theobald's Road, London, W.C.1, to take some of the poor crippled children of Bethnal Green for a good day's outing in Epping Forest. A date will be fixed in July. Any help will be greatly appreciated by the Society.

The Popularity of the Passenger Machine.

The predominance of sidecar machines over solo mounts now on the road is most marked, and where the single track machine is used, fully 50% carry a passenger on the pillion. In club runs especially is the popularity of the passenger machine made manifest: as an example, at the Redditch and District M.C.C. opening run last week between thirty and forty members were present, only two of whom were riding solo.

Twenty-hour Open Trial in Ireland.

The twenty-hour open reliability trial organised by the Cork and District M.C.C. will be held on June 9th over the 1915 course, viz., Cork, Fermoy, Dungarvan, Carrick-on-Suir, Clonmel, Mitchelstown, Cork, Killarney, Waterville, Kenmare, Macroom, and Cork. An average speed of 20 m.p.h. is to be maintained, and Gowlane and Ballagisheen Hills will be "observed." There will be no split-second timing at secret checks. First-class awards, gold medals; second-class, silver medals; third-class, bronze medals.

As the committee are not satisfied with any of the usual methods of finding a winner of a single cup, substantial presentation prizes will be awarded to all competitors qualifying for first-class awards. The trial should be a very sporting event, as the club, in framing the rules, has taken into consideration the fact that few 1919 models are available. Rules, entry forms, and full particulars may be obtained from the hon. sec., Mr. R. S. Russell, 4, Prince's Street, Cork.

A scene at the start of the first official run of the Edinburgh Motor Club which took place last week.

Chairman of A.C.U. Competitions Committee.

The Rev. E. P. Greenhill has been unanimously elected chairman of the Competitions Committee of the A.C.U., with Mr. A. G. Reynolds as the deputy chairman.

"The Motor Cycle's" Recruits.

The O.C. of a Motor Machine Gun Battery writes from the Caucasus: "All the best men in this battery who served with me in France were recruited by *The Motor Cycle*."

Results of Birmingham-Llangollen Trial.

The premier award in the Birmingham M.C.C. two days' trial to Llangollen and back was won by H. P. Cutler (4 h.p. Norton sc.). The special prizes in Classes A and B were awarded to G. R. Morgan (4 h.p. Triumph sc.) and W. A. R. Bown (2½ h.p. Bown-Villiers) respectively, while T. F. Watson (4 h.p. Norton sc.) won the novices' prize. In addition to these, twenty-eight competitors were awarded silver medals.

Defining the Trade Rider.

The old-time difficulty of defining a trade rider is agitating motor cyclists in the North. The Motor Cycle Board of the North-Eastern Automobile Association has a rule that "No official of the Board shall be connected with the motor trade as a means of earning his livelihood." This is felt to be too sweeping, but a just definition is difficult. The question will probably be considered by the Motor Cycle Board at its first post-war meeting called for to-night, the 29th, at Newcastle, when the question of competitions for the present year will also be settled.

Our Summer Number.

Full of interest and valuable hints and information set forth in a bright and interesting manner, the Summer Number of *The Motor Cycle*, which will be published on June 19th, will provide matter for thought, help, and entertainment of motor cyclists the world over. The contributions include articles on many phases of motor cycling—summer tours, picnicking, competitions, sidecar matters, design, etc., all fully illustrated, and it should be of more than ordinary interest to all who have occasion to use the motor cycle.

York Club Trial.

At the reliability trial held on the 21st inst. the club gold medal was won by G. A. Walker (three-speed Triumph), and the second award, a silver medal, was secured by R. B. Russell (Triumph two-stroke). The run took place through some of the finest scenery in Yorkshire, and the weather was ideal.

London-Edinburgh Run—Lights and Numbers.

Competitors are warned that they must take special care to see that their registration numbers are of the correct size and are properly illuminated.

SPECIAL SUMMER NUMBER

Our issue for JUNE 19th will be enlarged, and contain many special articles of more than usual interest to every motor cyclist.

Competitors are also reminded that in electric lamps the bulbs must not exceed 24 watts (24 nominal candle-power); in acetylene lamps the burners must not consume more than 21 litres of gas per hour. The front glass of all electric and acetylene lamps in which the diameter or longer side (according to whether the glass is circular or rectangular) exceeds 5in., all electric lamps in which the bulb exceeds 12 watts or 12 candle-power, and all acetylene lamps in which the gas consumed is more than 14 litres per hour, must be obscured with at least one thickness of ordinary white tissue paper.

Triumph Prices.

We are advised that owing to the present cost of labour and material the retail prices of Triumph motor cycles will be increased on June 10th. The new prices will be: 4 h.p. three-speed model, £92; 4 h.p. T.T. roadster, fixed gear, £75; two-stroke, £60.

Helping the Motor Car Novice.

There appears to be the opinion of many motor cyclists that cars require far less attention than do motor cycles.

That car owners have their little troubles the same as motor cyclists is confirmed by the demand for "Faults and How to Find Them," by J. S. V. Bickford, M.A., which is published by our sister journal *The Autocar*. This handy little book has now reached its fifth edition, and fully explains remedies for over eleven hundred "faults," and in addition gives a valuable chapter on electric lighting and engine starting sets.

The price of the book is 3s. 6d., and is obtainable at all first-class booksellers, or direct from our publishing offices, 20, Tudor Street, E.C.4.

A Sporting Trial on the Edge Hill Range.

Coventry Club's Event for the Manville Trophy.

MAGNIFICENT weather favoured the competitors in the Coventry and Warwickshire M.C. non-stop reliability trial last Saturday, when thirty-four members started over a sporting course for the Manville trophy.

The enthusiasm shown augurs well for the future of the club, and, although there was nothing strikingly original in the nature of the trial, the stopping and re-starting test on Sunrising Hill provided interest as exemplifying the skill of the riders as well as the quality of the clutches of the various machines.

A speed of nineteen miles an hour was required to be maintained over the course of eighty-one miles, which included Edge, Sunrising, Tysoe, Sibford-Ferris, and Avon Dassett hills.

Incident during the first part of the run was not particularly evident. Bicknell (8 h.p. Matchless) unfortunately experienced tyre trouble, as did Ingall (Lea-Francis), otherwise all competitors reached Edge on time.

This famous, but not particularly formidable, hill is light work for any modern machine, although certain competitors took the hill more happily than others. Lt. Milner (2½ h.p. Diamond) came up well. Rycroft, Close, Auerhaan, and White (Triumphs) made fast ascents.

Probably the fastest climb of the solo riders was that of Stretton-Ward, who, unfortunately, broke a valve on Sunrising and retired.

Several of the sidecars ascended the hill on second gear.

A twenty-six miles run was scheduled between Edge and Sunrising, where the stopping and re-starting test took place, and here the setting was ideal. A more beautiful spot would have been difficult to

At the start of the Coventry and Warwickshire M.C. Trial last Saturday. T. R. Gibbins (4 h.p. Rex) being timed away.

find, white and purple lilac, brilliant yellow furze, and bright green foliage making a lovely setting for the colours worn by the ladies witnessing the test.

On this hill a few of the competitors appeared to look amazed when stopped by the marshal, and one could not but think that they had not read the rules very closely.

Sidecarists had the advantage over the solo riders, the latter having to balance the machine on the steep portion of the

hill; but, generally speaking, the performances were good, much better than the light cars that came up later.

One of the best restarts was made by Finch (4 h.p. Triumph sc.). The 8 h.p. Hazlewood, too, was handled well by K. Hazlewood. A. P. McGowran (Triumph sc.) manipulated his clutch splendidly, for a start on this position of Sunrising with a hub gear and sidecar requires some skill.

The 8 h.p. Sunbeam, ridden by J. E. Greenwood took the hill with ridiculous ease, and stopped and got away after the start as fast as any of the solo riders—probably the best performance. The impression formed was that modern clutches can be handled with far less care than of old. They are more fool-proof, and none of the machines gave the impression that they were fitted with harsh, ill-designed clutches.

Crawley (Triumph sc.) suffered gear trouble, and covered fully two-thirds of the course on the second ratio, but did remarkably well.

Several competitors went off the course, while a few got lost altogether before they reached Sunrising.

The following were checked in at the finish: G. H. Thomas (2½ h.p. Monopole), Lt. A. Milner (2½ h.p. Diamond), H. Finch (4 h.p. Triumph sc.), N. Rycroft (4 h.p. Triumph), H. Close (4 h.p. Triumph), T. R. Gibbins (4 h.p. Rex), W. E. Johnson (3½ h.p. Humber), A. E. Auerhaan (4 h.p. Triumph), G. L. White (4 h.p. Triumph), G. Dance (3½ h.p. Sunbeam), De la Hay (3½ h.p. Sunbeam), A. P. McGowran (3½ h.p. Triumph), H. Whitten (3½ h.p. Humber), K. Hazlewood (8 h.p. Hazlewood), H. D. Teage (4 h.p. Triumph sc.), S. Crawley (4 h.p. Triumph sc.), J. A. Dudley (3½ h.p. Sunbeam sc.), J. E. Greenwood (8 h.p. Sunbeam sc.), and A. R. Grindlay (7-9 h.p. Harley sc.).

Capt. H. D. Teage (4 h.p. Triumph sidecar) restarting on Sunrising, with K. Hazlewood (8 h.p. Hazlewood) behind.

The Glasgow M.C.C. Open Climb.

Some Fast Ascents of "Rest and be Thankful."

THE first and open hill-climb of the Scottish season was held on Saturday last. The venue, which was kept secret, turned out to be the famous "Rest and be Thankful" hill, well-known to competitors in the Six Days Trials. An entry of twenty-two, fairly representative of the best riders in Scotland, assembled at the bottom of the hill in perfectly ideal weather.

The event consisted of six classes as follow:

1.—Motor cycles having cylinder capacity not exceeding 350 c.c.

2.—Motor cycles having cylinder capacity exceeding 350 c.c. and not exceeding 600 c.c.

3.—Motor cycles having cylinder capacity exceeding 600 c.c.

4.—Motor cycles and sidecars not exceeding 600 c.c.

5.—Motor cycles and sidecars exceeding 600 c.c.

It was decided to give each competitor two attempts, the fastest ascent to count. Timing was worked by means of synchronised watches, and worked satisfactorily. The surface of the hill was comparatively good, and, with the exception of a little looseness at the corners, was favourable to fast times.

Owing to lack of entries, Class 1 was not run off. Competitors started well down the hill, and the finish was about 100 yards above the well-known hairpin. Roughly the distance covered would be a mile and a half.

Class 2, the first class run off, provided some good riding, W. Deans (3½ h.p. Ariel) taking the hairpin well in both climbs. Capt. Walker (3½ h.p. Triumph) also performed creditably, taking the corner well out, and running no risks. J. W. Walker (3½ h.p. Norton) stopped half-way up the long slope.

The big class produced the best riding of the afternoon. D. M. Brash (7 h.p. Harley-Davidson) was first to start, but the hairpin gave him some trouble.

A sidecar on Rest and be Thankful during last Saturday's hill-climb.

A. H. Alexander (7 Indian) had distinctly hard lines. He travelled up the long slope at a good speed, but, if anything, took the hairpin too fast. Keeping close in on the corner, he was practically bumped off on the stony surface and stopped.

A. Brash (7 Harley-Davidson) made the best ascent of the day. Taking the corner at good speed, he never faltered or wobbled, and gave the impression that climbing "The Rest" was an every day occurrence. T. A. McCreddie (8 Sunbeam) made a good ascent, but not quite as spectacular as the previous competitor.

D. S. Alexander (8 Enfield) made an excellent ascent, his cornering and manipulation of gears being quite a feature.

In the 3½ sidecar class W. Deans (3½ Ariel sc.) and H. W. Ballardie (4 A.J.S. sc.) gave good accounts of themselves. N. Fraser (3½ Sunbeam sc.) was, if anything, a little slower, but nevertheless made a good ascent.

The big sidecar class produced some good cornering, and it was surprising to

see the manner in which the combinations romped up the hill. Here again A. Brash (7 Harley-Davidson sc.) proved that the corner could be taken at speed, and, keeping close in, had no difficulty in surmounting the steep gradient at this point. The spectators were provided with plenty of thrills in this class. J. Barclay (6

A. Brash, 7-9 h.p. Harley-Davidson, taking the bend on Rest and be Thankful in good form.

A.J.S. sc.), ascending at great speed, took the corner very fast, and in getting around the bend ripped off his sidecar tyre. Amidst the shouts of the onlookers, he finished on the rim. D. S. Alexander (8 Enfield sc.) repeated his performance in the solo class, making the very best use of his gears. J. Gunning (7 Harley-Davidson sc.) had rather an unfortunate experience. He simply roared up to the bend, and in his effort to take the corner turned completely over. His passenger was badly shaken, but luckily neither was seriously damaged. This competitor had never been up the hill previously, and a trial run would have obviated what might have been a very serious accident. The results will be announced later.

J. W. Walker (3½ h.p. Norton) at the start of the Glasgow hill-climb held last Saturday.

THE FIRST GOVERNMENT AUCTION SALE.

Unused Machines in Neglected Condition realise High Prices.

After many months and after frequent urging by *The Motor Cycle*, the Government has at last made a start to dispose of the "unused" surplus army motor cycles. The crates shown contain 2½ h.p. Douglasses which were sold for figures around 74 guineas.

ON Saturday, at the Royal Agricultural Hall, Islington, under the direction of the Surplus Government Property Disposal Board, some 300 motor cycles and sidecars were offered by auction by Messrs. Goddard and Smith.

So well had the sale been announced that buyers, and would-be buyers, came from all parts of the country in search of bargains. In fact, a queue some 300 yards long had formed before the opening time; once inside the hall, the long procession of people passed the remains of an aeroplane engine exhibit, went through the main hall, with its collection of lorries, and arrived at the Gilbey Hall, where the motor cycles to be sold were arranged.

It had been hoped that the machines offered would be of better quality than those previously put before a none too enthusiastic public, and also that this sale might mark the decline of the fallacious and exorbitant price reached hitherto. Neither of these hopes was gratified, and there were a great number of machines of the type now referred to as Kempton Park models.

"New" Machines Unrideable.

It is true that, within crates, in the centre of the hall were rows of Douglas 2½ and 4 h.p. machines which had never been issued to troops, but on either flank was a hopeless collection of rusty, incomplete motor cycles in the last stages of decay and filth. Even the machines which had not been issued were, in the majority of cases, unrideable, since the tyres had decayed until ominous cracks showed round the walls.

Naturally, one cannot expect used machines to be in really good condition, for Army work is strenuous and the riders, often careless, always busy. One does expect, however, that new machines, still in their crates, should be serviceable, and that the prices to be paid shall represent their value.

The taxpayer part of the motor cyclist will rejoice exceedingly at the high prices, but the real motor cyclist portion of him will grieve.

Passing round the machines one had a good idea of their state. For instance, No. 3, a Triumph, had no belt, no carburetter, no magneto, no front wheel, no rear tyre, no leather on the seat, a much bent gear lever, and no footrests. Yet, for this contraption, in a rusty condition, twenty-one guineas were paid. For another Triumph with both wheels, but wonderfully rusted, without carburetter or magneto, the sort of thing, in fact, that no man would have had before the war, no fewer than forty guineas were expended. Prices for the first collection averaged about £19.

Neither the B.S.A.'s nor the Scotts were in better condition, while some of the Douglasses had just come from an unown field and brought the grass with them.

A Matchless and sidecar fetched sixty-one guineas, and really was a bargain according to that day's prices; but even on this machine the Service "scrounger" had done his worst. Some Indians belonging to the Canadians had their magnetos and carburetters, but apparently this made but little difference to the price.

Some Enfield ammunition carriers in had condition, but not absolute wreckage, fetched from seventy to sixty-six guineas, and the buyer would have to spend some £20 on repairs, and perhaps £30 for a sidecar.

After the lunch interval the unused machines came up, and the crowd became much denser. The price of eighty-two guineas for a 2½ h.p. Douglas, however, was too much for the majority, and was greeted with loud and derisive cheering. Thereafter things settled down, similar machines bringing seventy-four guineas to the taxpayer, until lot No. 135—another 2½ h.p. Douglas—brought the price to seventy-two guineas.

After lot 148 the price fell a little, but

at 156 it went back to seventy-one guineas amid groans and hoots and whistles.

Thereafter the seventy guinea line was held, until the last few machines went at seventy-one guineas.

After the 2½ h.p. came the 4 h.p. and sidecar Douglasses, and prolonged and surprised whistles greeted the opening price of 125 guineas, beaten by the next machine, for which 130 was the figure. Thereafter each combination went at 125 guineas.

One or two lots caused heated arguments, and once the auctioneer had words with a derisive spectator, to the intense joy of the gathering.

Dissatisfied Bidders.

Following the better machines the third batch, consisting of Douglas wreckage, provided little excitement, and a large portion of the crowd went home. Prices for 2½ h.p. Douglasses in very bad condition ranged from eleven and a half to nineteen and a half guineas.

The rostrum was a raised platform on which was the auctioneer flanked by the military. In front were seats for some 300 people, around stood a huge crowd; and in the future it would be well if the auctioneer were provided with a megaphone. Actually at fifty yards' range it was impossible to hear a word or to know which machine was being sold. Naturally, this made a hot and tired crowd very restive, and for the first half-hour of the afternoon it looked as though trouble was brewing. Derisive cat calls, whistles, and shouts of "Fetch a megaphone," "Will the auctioneer speak up?" and "What number are you selling?" completely drowned speech even at shorter range, while the people on the fringes of the crowd pushed and struggled to the discomfort of all.

It is all very well to sell motor cycles at high prices, but surely it would be better to arrange that all might hear the figures even if only as a lesson.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Herford Street, Coventry, and must be accompanied by the writer's name and address.

AN IDEAL SINGLE.

Sir,—In reviewing the several post-war models of well-known makes, one cannot but notice that manufacturers are disinclined to make any radical alterations in their designs. As a rider and admirer of the Norton single, might I suggest one or two improvements on this otherwise excellent model? 1. Change of position of the magneto to behind the engine, as per T.T. Rover. 2. Flat rims, with 650 x 65 mm. tyres. 3. A slightly shorter wheelbase. Then indeed should we have the ideal single. SPEEDIRON.

Lee, S.E.

THE C.F.B. CYCLE CAR.

Sir,—I am venturing to write to you for the first time, having been a reader of your paper for about six years, with reference to your preliminary account of a proposed new cycle car, described in your issue of April 10th, 1919, and named the C.F.B. cycle car. My only regret is that the designer has only got to the stage of having an experimental model built, as, for my part, I consider the design in every degree excellent (with one exception), that is, of course, as far as the present description goes. If the designer happens to read this letter, I hope that he will see his way clear, at a very early date, to let us have a full description of his design. I cannot help saying that there are thousands of others at present in the Forces who are looking for just such a machine as this, and I congratulate the designer on a good looking and reliable machine. The exception I mentioned above was that I think a single chain drive to the rear axle would be far preferable to the belt drive shown, and would not, I venture to think, add a great deal to the cost.

In conclusion, I hope to see a further description of this machine, and, better still, to own one in the near future at £100. CHAS. W. PERCY.

E.E.F., Egypt.

STANDARDISATION OF CHAINS.

Sir,—With reference to a paragraph in your issue of April 24th, stating that Messrs. Brampton Bros., Ltd., the Coventry Chain Co., Ltd., and Hans Renold, Ltd., had agreed on standard sizes for chains, I am instructed to inform you that the figures quoted by you are incorrect. The three firms above named and Messrs. Alfred Appleby Chain Co., Ltd., are considering the question of standardisation, but are not yet ready to put forward details. Full information will be given to the press in due course.

F. LINDSAY FISHER, Secretary,
Association of British Driving Chain Manufacturers.

ONE-DAY TRIALS.

Sir,—May I make a few remarks concerning the details of the Midland Cycling and Athletic Club's one day trial, as printed at some length in *The Motor Cycle* of May 15th?

Why take a trial for more than 200 miles? Surely 100 or 120 miles is quite long enough for a one day trial, and why give as reason for such a long journey that it enables some extra stiff hills to be included? Surely hills like Birdlip or Rising Sun are quite stiff enough. What ordinary rider wants a machine to climb hills any stiffer than these?

I also note that the course is to be kept a secret. Why is this necessary? Surely one of the objects of a reliability trial is to create interest in the pastime, and how can the average man arrange to get to the most interesting parts of the course if the route is kept a strict secret until shortly before the start?

TOURIST.

Birmingham.

ONE-LEGGED RIDERS.

Sir,—In reply to "Gammy-leg's" letter, *re* one-legged riders. I am also minus a prop (the left one), and recently got a new Royal Enfield combination which is just "it." There are no foot levers on the left side, and in fact, only one foot lever, viz., the rear brake. The foot-boards are long and of a good width, and are also sprung which means a lot as the wooden one is not so apt to jig off. Also having a handle-starter it again meets one's needs, and I might add that from cold a couple of turns are sufficient. I have no connection with the Enfield firm, but have found them to be most courteous in all their dealings. PADDY.

Portadown.

SPARE PARTS.

Sir,—You publish two letters *re* spare parts in your issue for May 8th. May I give my experience?

I have a 1913 Humber, and broke the spindle of my kick-starter. I wrote the makers for a quotation, and in their reply they said the parts were not in stock but would have to be made. I ordered them, and they came through in less than a week, and this just before Easter. I then ordered some oversize piston rings to be specially made, and they came through in a short time at less cost than any of the cheap firms advertising in the papers would do them.

Another firm is Mr. Perkins, of Leyton, who sells adjustable pulleys. I ordered one Thursday, and he despatched it the following Saturday afternoon.

The usual disclaimer.

EDGAR CARR.

EMPLOYMENT FOR DESPATCH RIDERS.

Sir,—It was very gratifying to note that the work of motor cyclists during the war had been so much appreciated that the A.C.U. were considering the advisability of suitably commemorating their services. What would be infinitely more gratifying is that something be done in the matter of employment for some of us D.R.'s who have been demobilised and who have been experiencing very great difficulty in obtaining jobs.

Personally (an ex-D.R. with 4½ years' continuous service in Mesopotamia, Palestine, India, and Egypt—part of this time an infantryman) I have applied to those well-known makers, whose machines I have ridden under all conditions, for any kind of job, only to be met with the reply that, "owing to having to re-instate all their pre-war employees, they can hold out no hopes at present." I grant that this is highly creditable to the firms, and their pre-war employees should count themselves very lucky, but those who have no jobs to go back to and those of us who came from the Colonies to join up in 1914 are still on our beam ends.

Cullompton.

L.A.C.

AN IMPOSITION AND A WARNING.

Sir,—I recently purchased a new motor cycle from an agent in a well-known Varsity town. I went over and drove the machine away. Nevertheless, the agent had the audacity to charge me for the crate, 25s. I paid, but took the matter up, and found from the manufacturers that he had no right to make this charge, the price of crate being included in the price of the machine. Pressure was brought to bear, and the money refunded.

This may be of interest and help to others. If any have had to pay, as I did, they should take immediate steps to recover their deprivation. This sort of thing should be stopped at once. It is bad enough to pay such high prices for machines without paying *twice* for a crate.

VOXN PAH.

THE MOTOR CAR ACTS AS APPLIED TO THE MOTOR SCOOTER.

Sir,—May I, through the medium of your valuable paper, offer the suggestion and invitation to those manufacturers and others interested in the scooter movement, that a combined effort be made to secure modification of the Motor Car Acts of 1896 and 1903, as applied to the auto-scooter.

Bearing in mind that the h.p. of the motor scooter proper should never exceed 2 h.p., and the weight 80 lb. maximum, at least a 50% reduction in tax should be made. Also, with a lightweight vehicle of this type, two powerful brakes are not only unnecessary but dangerous. E. O. STAFFORD.

EVOLVING A MOTOR CYCLE FROM FIRST PRINCIPLES.

Sir,—Maj. Waterlow's article on motor cycle design from first principles is open to criticism.

With reference to fig. 1, by applying first principles of forces in structures, it will be found that the members E from head to saddle strut, and saddle strut to beam carrying rear wheel, are not in tension but in compression, and therefore to be economical and prevent undue loading of the tie-rod from beam B to main frame A there must be struts.

With regard to the use of an aluminium alloy casting for such construction, I do not think anything is to be gained, as far as saving in weight is concerned.

I would pin my faith to steel in the form of pressings. From a cost point of view, it does not appear by any means cheap. A. R. HENDERSON.

THE NEW A.B.C.

Sir,—As a rider in the Tropics, allow me to endorse what you and others have said in criticising the new A.B.C. motor cycle regarding the necessity for a wholly enclosed chain case. This is absolutely necessary in tropical countries, where, for nine months in the year, the wheels will be driving through thick dust, which, combined with the oil, soon wears chain and wheels. It is the lack of this on a chain-driven machine which makes me hesitate to invest in an A.B.C. I notice also that "a series of large rubber buffers" are used in connection with the "cush" drive. Rubber in any form used in any article in the Tropics is fatal, as it perishes in no time. One other point, the sheet metal frame in front of the engine. This, it is stated, has adjustable airways. Will these be sufficient for temperatures of 100° and over in the shade? Calcutta. INDIA.

SCOTTISH FERRIES.

Sir,—I write to correct a statement made by A. Scott Freeman in his letter to *The Motor Cycle* of May 15th, in which he says: "It is necessary, however, for the tourist to apply for a passport to travel north of Inverness." The regulations regarding passports for the Highlands were suspended on November 30th, 1918, and one may now travel anywhere in these parts with absolute freedom.

A. Scott Freeman is again in error when he says that the "ferries north of Inverness are rough and ready affairs." The Kessock Ferry from Inverness to the Black Isle (Ross-shire) is one of the best that I have ever travelled on. The boat, which is propelled by steam, is constructed to carry almost any touring car. The fare for motor cycle and rider is 9d. The boat sails once per hour on week-days. The Bona Ferry, which transports travellers from either side of Loch Ness, is also up-to-date, although, so far, big cars are unable to utilise it. Mr. H. Smith, the manager of the company, has a sensible scheme on hand, whereby touring cars of any size will be accommodated shortly. The fare on this ferry is 1s. 9d. for motor cycle and rider. The ferry from Ballachulish to Onich is capable of carrying cars of any size. This ferry is sometimes suspended through bad weather, otherwise it runs every day. The fare for motor cycle and rider is 2s. 6d., which includes an all-in insurance policy.

S. MACKENZIE.

PRICE OF PETROL.

Sir,—The Automobile Association has been told for many months that the cause of the exorbitant prices of petrol was that the Government had purchased such enormous stocks at high prices that they insisted on such prices being kept up to avoid serious loss.

We were further informed that, as soon as the petrol companies were free to market their own stocks, we should see an immediate and appreciable fall in prices.

The long-looked-for moment has arrived, and we learn that the price of No. 3 grade petrol is 2s. 11d., and that of No. 1, 3s. 1d. What a magnificent concession!

It is, surely, yet another proof, if such be needed, of the grip the Trusts have on the industry, and I would once more ask all motorists to join in the A.A. campaign in favour of the production of the trust-free fuel, viz., benzole.

Let all motorists insist that benzole shall be produced to the fullest extent of our country's resources, and let every one of us use benzole when and wherever possible.

I may add that the Fuel Department of the Automobile Association has in the press at this moment a list of several hundred suppliers, which will shortly be available for all members.

STENSON COOKE,
Secretary, The Automobile Association and Motor Union.

HILLS ON WHICH I HAVE FAILED.

Sir,—In reading the very interesting article "Hills on which I have failed" in *The Motor Cycle* for May 1st, I notice that "Veteran" alludes to the 1 in 3½ bit on Sutton Bank. Now the steepest bit on Sutton Bank is practically 1 in 4, which is a very different proposition. During the Easter holiday I did a good deal of stiff hill-climbing on a standard geared 3½ Sunbeam (1916), including Rest-and-be-Thankful, Kirkstone Pass, Spital of Glenshee, and Sutton Bank. I was unable to take my passenger up the last-named hill with an engine that had run 800 miles since cleaning, and was about ready for decarbonising, but on dropping the passenger the machine started at the steepest point and sailed up in fine style. The surface is very bad.

I think your readers would appreciate a chart showing, say, the gradient of twenty or thirty worst main road hills in Great Britain which could be pasted on cardboard and hung in the cycle shed or house.

Furthermore, unless "Veteran" is writing entirely from a "solo" point of view, I would differ with his statement that a novice can set out on practically any modern machine and climb these hills very often without recourse to bottom gear. I have been driving fourteen years, and during touring conditions find that when I tackle hills like Kirkstone Pass and Rest-and-be-Thankful without stopping to cool down at the bottom, it takes all my skill and the use of the bottom gear to make a clean ascent with passenger and coachbuilt sidecar, and think it would be rather disheartening for a novice to set out for a 1,000 miles to tackle the collection I mention, and expect to sail up either on half-throttle or middle gear.

Halifax.

SUNBINKS.

[We published details of the principal hills in Great Britain in *The Motor Cycle* of March 28th, 1912.—En.]

Many large engineering works now have their own motor cycle clubs. A meet of the Siddeley-Deasy M.C.C., which club is composed of motor cyclists who help to produce Siddeley-Deasy aero engines and cars.

A biplane of simple design produced by an American motor cyclist, who used his twin Indian engine as the power unit. It is stated that a speed of 45 m.p.h. has been attained.

A TABLOID HISTORY OF AIR-COOLING.

Sir,—In his letter on the above subject (May 15th) "Pitot" gives some figures which are so absolutely hopeless that correction is necessary.

I have made out a table giving the correct horse-power and consumption, and also stated the reports from which my figures have been taken:

H.P.	Engine.	Consumption, Galls./Hr.	
200	S.P.A. 6A	13	<i>Aeronautics</i> , 27th March; <i>Flight</i> , 3rd April 1919.
260	Puma ...	18.69	Ditto, ditto.
230	Benz	18.75	"Enemy Aircraft Engines" (Hiffe and Sons Ltd.).
250	B.R.2 ...	20	<i>Aeronautics</i> , 27th March; <i>Flight</i> , 3rd April 1919.
150	B.R.1 ...	11	Ditto, ditto.
110	Clerget ..	9.17	Ditto, ditto.
130	Clerget ..	10.9	Ditto, ditto.

From the above table it will be seen that "Torque" was fully justified in saying that a rotary consumes about one-tenth of a pint per b.h.p. per hour more than a stationary—in fact, he is well on the safe side.

As regards the R.A.F. 3A, I have tested a good few of them, and, on an average, they developed 250 h.p. with a consumption of between 17 and 18 g.p.h.

It is hardly necessary to point out that the figures obtained on a bench test are the ones to go by, and also that the proper way when comparing engine performances is to express the consumption in pints or pounds per b.h.p. per hour. If "Pitot" had only known something of what he is talking about he would have known that it is an absolute impossibility to determine the horse-power and consumption of an engine when flying at 15,000 feet with the instruments supplied in an aeroplane. I should advise "Pitot" to read a most excellent article on "Flowmeters" in *The Automobile Engineer* for May, and he would perhaps begin to realise the extreme accuracy required when determining the consumption of an aero engine.

B.Sc., A.M.I.A.E.

Derby.

EXPERIENCES WITH A 3 H.P. TWIN.

Sir,—I always read with interest the pages of your publication, but "F.A.S.'s" article in your issue for May 15th, under the heading of "Experiences with a 3 h.p. Twin," strikes me as being particularly unfair to the make with which it deals. I have owned a similar machine for the last two and a half years, and perhaps you will grant me space to state my experiences.

To treat the points at issue as they arise:

(1.) "F.A.S." states "the highest speed recorded was 46 m.p.h." Without tuning of any sort I have frequently reached a speedometer reading of 48 m.p.h., with a passenger on the pillion.

(2.) His petrol consumption of 105 m.p.g. is quite a conservative estimate. I have averaged this without altering the air intake in any way, and 75% of runs are performed with "two up."

(3.) Why does he have this difficulty in starting up? I have never injected fuel into the cylinders, and find that, by flooding, two or three kicks are sufficient, including winter conditions and No. 3 petrol. I may say that I never "paddle off" my machine, and, after 4,000 miles, the kick-starter is as lively as ever.

(4.) My height is 6ft. 1in., and yet I find perfect comfort in the riding position. Perhaps "F.A.S.'s" extra inch makes all the difference, or is he broad in rather more than proportion?

(5.) What is wrong with the kick-starter position? I find that, should one inadvertently stop the engine in traffic, it is quite possible, if there is a little "weigh" on the machine, to "kick-start" up again without placing a foot to the ground. The direction of push allows plenty of leverage.

Why has he omitted to mention the front wheel brake (mine has never worked), and would it not be preferable to have a lubrication tell-tale which does not necessitate leaving the saddle?

KENNETH COHEN, Sec. Lt. R.A.S.C.

PLEASE QUOTE PRICES!

Sir,—I believe that thousands of motor cyclists will agree with me that advertisers who use your excellent medium would do far bigger business if they stated the prices of the goods they offer in the advertisements.

They tell us all about the merits of their wares and ask us to write for "interesting booklet." This may be all right in the case of new model solos or combinations where a prospective buyer naturally does not make up his mind without studying several specifications, but in the case of accessories and "gadgets" generally, if he likes the look of a thing on paper, and considers the price reasonable, in eight cases out of ten he will get one from his dealer, or will write to the advertiser direct, enclosing cheque or P.O. But he often will not trouble to write twice.

I have dealt satisfactorily as a customer with several of your advertisers with good things to offer and who have the "savvy" to state the price; but, on the other hand, the advertising pages of my copies of *The Motor Cycle* are earmarked for months back as advertisements of things I certainly need and should have bought long since no doubt were it not for the annoying omission referred to.

It may be a small matter, but I believe that our big cash chemists and tea companies long ago recognised the fact that people will not even trouble to cross the road to make a purchase if they can help it, much less go to the trouble of preliminary correspondence to get what they want.

Brighton.

ILIFFE & SONS Ltd., 20, Tudor Street, London, E.C.4
or of leading Booksellers and Railway Bookstalls.

QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

A Stuck Rocker Arm.

? I should be much obliged if you would tell me if there is anything one can do when the make and break of a magneto sticks in damp weather besides taking it down and drying it.—D.B.H.W.

You will require to reamer out the bush either by wrapping a piece of emery cloth round a match or by using a suitable reamer. In a case of emergency the tang of a file might be used, but this has much too steep a taper. On no account oil the part of the rocker which oscillates in the bush.

Burnt Exhaust Valve.

? My machine is a 4 h.p. Triumph running with a sidcar on benzole, and I am experiencing great difficulty with the exhaust valve, which burns out rather quickly. I am told this is due to running on too rich a mixture. Would you kindly give me your opinion? I may add that the seating is good, and the valve lifts about $\frac{1}{4}$ in. Also I find when running slowly, say about ten miles per hour, and coming to a corner where there is a big dip on the road, the explosion blows back into the carburettor. This also takes place at times when running at low speed and coming to a bit of very bumpy road. To get over it I have either to open the throttle or reduce air, but find that opening the throttle too suddenly causes the engine to knock if running on petrol. I also find the engine knocks when using petrol if I try to accelerate up a gradient. These knockings are absent when using benzole, although I can feel that the explosion is more powerful, and cannot quite understand why this is so. My carburettor is a Triumph make, and is fitted with two sets of holes against the jet. The smaller and upper set can be closed with a slide. I have tried with the slide open and closed, and can observe no difference in running.—C.B.

Too rich a mixture is quite probably the cause of the burnt valves, as benzole requires a great deal more air than petrol, and it may be advisable for you to fit an extra air valve of some sort between the carburettor and the cylinder, but it is perhaps better to try the effect of a smaller jet first. Examine the inlet valve spring, and see if it is weak. Your ignition timing appears to be slightly too far advanced. The contact breaker points

should just be separated when the piston is about one-sixteenth down the firing stroke, with the spark lever in fully retarded position. Benzole is a slower burning fuel than petrol and requires a higher temperature for ignition; also the explosion is not so violent, but quite as powerful, so that it is not so liable to cause knocking. The holes at the bottom of the throttle barrel are the ordinary air supply holes.

Dynamo Lighting.

? I should be pleased if you would give me the following information: Particulars of wiring for Berko dynamo when using a head lamp and tail lamp, either separate or together. The Berko is driven by contact with the rear wheel tyre. The candle-power, voltage, and amperage of lamps needed for head and tail lamp. Are these dynamos satisfactory when used in conjunction with a dry battery? Would the ordinary pocket flash screw bulb be suitable for the tail lamp, or would it burn out? Particulars of wiring for dynamo, dry battery, and switch for using battery for both head and tail lights when machine is stationary.—W.F.H.

The best way is to wire your head and tail lamps up in series. That is, take a wire from the insulated terminal of the dynamo to a switch on the handle-bar or other convenient spot, from there to one terminal of your head light, from the other terminal of the head light to the tail lamp, and connect the other terminal of the tail lamp to earth, making a good connection to the frame. Both terminals of the head lamp must be insulated. The other terminal of the dynamo must also be earthed on to the frame with a wire. In the above case use a four-volt lamp taking $\frac{3}{4}$ ampere for the head light, and a two-volt lamp taking $\frac{3}{4}$ ampere for the tail light. These will give about 3 and $1\frac{1}{2}$ candle-power respectively. The dynamo cannot be used in conjunction with a dry battery. You could, however, if you wished, use a dry battery for your tail light only, and use the dynamo entirely for the head light, when a six-volt lamp bulb should be employed for the latter. The bulbs used for the ordinary pocket flash lamps must not be used in conjunction with the dynamo, but are suitable where a dry battery is made use of for the tail light as mentioned. To provide a head light when standing will necessitate a separate battery, with its own switch.

Disabled Rider.

? Since I am unable to use my left foot, could you let me have a list of makes of motor cycles which have no foot controls on the left side, and which are also fitted with a kick starter?—J.S.B.

Two prominent machines which have no foot controls on the left side are the P. and M. and the Enfield, but the latter is started by handle. It may interest you to know that Maudes' Motor Mart, Great Portland Street, London, W.1, make a speciality of conversions for disabled riders. All you would require would be the foot brake on the right-hand side and a handle-bar-controlled clutch.

Mysterious Trouble with a Two-stroke.

? My 2 $\frac{1}{2}$ h.p. 1916 two-stroke Ixion was overhauled and taken out for test. The machine started off all right, and simply flew up a steep hill. I turned round and came down the hill with the air and throttle levers shut, but with the engine under compression. On reaching the bottom I opened the throttle, but the engine would not start, and I had to wheel it home. Since then I have tried to get it going, but with no result. The compression is good, but with a hot plug and hot petrol injected into the cylinder it will not fire. Would it be of any use to take the engine down and clean it again?—A.W.

It is impossible to say definitely what the trouble is with your machine without examination, but the first thing to do is to remove the plug, and, by revolving the back wheel, see if you get a spark. If you get a good one you will know there is nothing wrong with the ignition. Next turn your attention to the carburettor, and see if the jet is clear and the float chamber floods easily. As you have tried with petrol injections, however, this is not likely to be the trouble. The timing of the spark may possibly have slipped. Check this by putting the spark lever in central position, turn the engine pulley till the piston is at the top of its stroke, when the magneto contact breaker points should be just about to separate. If they are not in that position, they will have to be altered by uncoupling the magneto driving sprocket and resetting the contact breaker position. As the compression is good, there is apparently nothing wrong with the rings, and there can be no other necessity for taking down the engine again. Observe whether the crank case is airtight and if there are signs of leakage at main bearings.

Magneto Shorting.

? I should be glad if you could enlighten me concerning the magneto on a Scott machine. When pulling the back wheel round with one hand on the frame I can feel the current. I am experiencing difficulty in getting it to start. The spark at the plug, when testing, varies a good deal, being sometimes good and then poor. With the magneto spanner on the brush terminals it throws a good spark between magnets and spanner.—L.D.

Obviously, if you can feel the current from the magneto all along the frame when revolving the magneto, it shows that the current is coming to earth or short circuiting instead of passing along the high tension wire to the plug. Without examining the machine it is very difficult to tell what is wrong, but you should carefully examine the high-tension cable to see if the wire is exposed and touching the frame. It might touch occasionally and cause the poor spark which you mention. Apparently there is nothing wrong with the magneto itself.

Aid to a Beginner.

? I have never driven a motor cycle (but have ridden a pedal bicycle for years), nor have I any knowledge of engineering. I am contemplating purchasing a motor bicycle and sidecar, and, as a preliminary, have been studying your book "Motor Cycles and How to Manage Them" and reading *The Motor Cycle* for the last month or two, and also seeking advice from friends who have motor cycles. I am now in a quandary, and am writing to you for advice. In the book you suggest at least 6 h.p. twin for sidecar work, but I see machines such as B.S.A., Ariel, etc., with single cylinders and less horse-power, advertised as all that is necessary for sidecars, and I also see many singles running which seem to get along all right. (1.) Please tell me the advantages, if any, of the more powerful machines. (2.) Referring to the book, how does one carburettor supply the two cylinders of a twin? (3.) Would it be advantageous to fit a carburettor to each cylinder? (4.) I often read "the engine is 74.5 x 80, 350 c.c.," etc. What do these figures refer to?—A.R.B.

(1.) A single-cylinder motor bicycle and sidecar of, say, not less than 3½ h.p., is quite satisfactory for ordinary touring, provided only one passenger is taken and not much luggage, but when you take a heavy passenger and a great deal of luggage a 6 or 8 h.p. would be necessary, and with such a reserve of power you would be capable of climbing any hill in the country, and hills abound wherever the scenery is most attractive. (2.) The carburettor is usually fitted with a T shaped or Y shaped induction pipe, and one carburettor is capable of supplying two or even four cylinders. (3.) No; it would be wasteful and extravagant. (4.) The figures mean that the bore—that is to say, the diameter of the cylinder—is 74.5 mm., and that the distance through which the piston travels in the cylinder is 80 mm. 350 c.c. is the piston displacement in cubic centimetres. This is all described in "Motor Cycles and How to Manage Them."

Pre-ignition.

? I have a 1914 2½ h.p. Douglas. The other day I was testing it for speed, and, having run at 38 m.p.h., it suddenly began firing in the silencer. After about twenty yards of this, the machine slowed down, and finally stopped. I took out the plugs, and could find nothing wrong. On restarting, it fired evenly until I ran over 30 m.p.h., when the same thing happened. On shutting off, the engine recommenced smooth running, and continued so long as the speed was under 30 m.p.h., the engine seeming to have a strong objection to exceeding this speed limit. I should be glad if you would explain the most probable cause of this trouble.—Lodge.

The trouble may be due to a partial obstruction in the petrol pipe, which so restricts the flow of petrol that when a greater amount is required at high speeds the supply fails and the carburettor becomes empty. It is more than likely, however, that you are using unsuitable plugs, which cause pre-ignition. This would also account for the symptoms you describe.

READER'S REPLY.**Timing a Two-stroke.**

I note that B.C.O. cannot get his Levis to run after an overhaul. I had exactly the same trouble, being unable to get the least sign of an explosion, after trying all three grades of petrol, and carefully checking the timing and eliminating all air leaks. In the end I emptied all the petrol out of the tank, filling up with benzole, and, to my surprise and joy, the engine started running with one pull over of the back wheel. I generally run with half benzole and half petrol, but it will start up and run well on petrol alone now, and invariably starts within two yards, and without giving an injection. What the original trouble was I do not know.—R. W. WHALLEY.

RECOMMENDED ROUTES.

STALYBRIDGE TO BIRMINGHAM.—P.H.I.
Stalybridge, Stockport, Altrincham, Northwich, Tarporley, Woore, Stone, Rugeley, Lichfield, Sutton Coldfield, Birmingham.

EALING TO BOURNEMOUTH.—C.F.H.
Ealing, Richmond, Kingston, Esher, Ripley, Guildford, Farnham, Alton, New Alresford, Winchester, Romsey, Cadnam, Lyndhurst, Hinton-Admiral, Christchurch, Bournemouth.

LIVERPOOL TO BIRMINGHAM.—H.W.H.
Liverpool, by ferry to Birkenhead, Chester, Whitchurch, Hodnet, Wellington, Crackley Bank, Gailey, Brownhills, Ferry Bar, Birmingham.

SHREWSBURY TO LLANDUDNO.—W.E.P.
Shrewsbury, West Felton, Llangollen, Pentre Voelas, Bettws-y-Coed, Llanrwst, Llanantffraid, Llandudno. Approximately 85 miles.

NORWICH TO MIDDLESBROUGH.—R.W.
Norwich, Hockering, East Dereham, Swaffham, King's Lynn, Long Sutton, Holbeach, Sutterton, Sleaford, Leadenham, Newark, Tuxford, Retford, Bawtry, Doncaster, Wentbridge, Ferrybridge, Aberford, Wetherby, Boroughbridge, Thirsk, Tontine Inn, Yarm, Stockton, Middlesbrough.

BATH TO PEN-Y-GRAG.—W.W.
Bath, Chipping Sodbury, Wickwar, Wotton-under-Edge, Berkeley, by train via Severn Bridge to Lydney, Chepstow, Newport, Caerphilly, Pontypridd, Pen-y-Graig. Approximately 60 miles.

CLAYDON TO BARROW-IN-FURNESS.—W.D.
Claydon, Stowmarket, Ixworth, Thetford, Mundford, Stoke Ferry, Kings' Lynn, Long Sutton, Fosdyke, Swineshead, Sleaford, Leadenham, Newark, Ollerton, Worksop, Aston, Rotherham, Wortley, Penistone, Huddersfield, Halifax, Kirkley, Skipton, Settle, Ingleton, Kirkby Lonsdale, Kendal, Ulverston, Barrow.

A Harley-Davidson put to strenuous use on a farm. We understand the machine performed the work of hauling this heavily-weighted trailer with ease.

Matchless Repair Works.

We are asked to state by Messrs. H. Collier and Sons, Ltd., the manufacturers of Matchless motor cycles, that the Matchless R.P.R. Works, Regent Park Road, London, N.W., are in no way connected with their firm.

British Motor Cycles in Denmark.

A notable success has been gained by B.S.A. riders in Denmark. In the Copenhagen M.C.C. 400 miles race, first and second places were secured by B.S.A. motor bicycles. These machines were the only competitors (motor cycle or car) to complete the course within the schedule time.

The A.B.C. Export Manager.

We are informed by the Sopwith Aviation and Engineering Co., Ltd., that they have just appointed Maj. H. A. Geaussent to take charge of the export department for their A.B.C. motor cycles.

Maj. Geaussent is well known to many of our Colonial readers, having been for several years previous to the war export manager for the Hutchinson Tyre Co.

Economy of Two-strokes.

The economy of the small ordinary simple three-port two-stroke when properly designed was well exemplified by the 198 c.c. Levis upon which Pike won a gold medal in the Victory Cup Trial. Careful measuring of the fuel used by this competitor revealed that his petrol consumption was 132 m.p.g., which is very remarkable, considering the nature of the course.

Larger Factories.

The Newcastle-upon-Tyne Motor Company have now moved to larger works at St. Thomas's Street, Newcastle. This new factory is being organised for high efficiency production of the N.U.T. motor bicycle.

The Rotax Motor Accessories Co., Ltd., inform us that they have removed their Birmingham works to much larger premises at Landor Street. These works are purely a manufacturing centre, and all correspondence should be addressed to the head offices at Victoria Road, Willesden Junction, N.W.10.

Universoline.

Some reference was made in the issue of May 1st to a preparation known as Universoline, sold by Sterns, Ltd. The preparation is for rendering joints, such as valve caps, gastight, and also preventing them from binding in the cylinder. We lately had some difficulty in removing the valve caps from a little engine which was rather apt to get hot, and after decarbonisation we treated the valve caps with Universoline, after which they were perfectly gastight, and yet after considerable use they were removed without difficulty.

Monogram Co. Reconstructed.

Those motorists who proved the quality of Monogram oil before the war will be pleased to learn that the reconstruction of the British Monogram Oil Co., Ltd., has now been completed, and a new company has been formed, under the title of the British Monogram Oil Co. (1919), Ltd., Stanley Works, Warple Way, Acton, W.3.

A Patent Friction Drive.

We are informed by Mr. F. C. Beauvais, 9, Barent Road, Camberwell, London, S.E.5, who is responsible for the C.F.B. cycle car described in the issue of April 10th, that the cone friction drive used on that vehicle has been protected, and patents are being taken out in respect of the other special features, and also in respect to the car as a whole. It is anticipated that the first car will be on the road at an early date.

Zephyr Motor Attachment.

We are asked by the London and Westminster Industrial Syndicate, Ltd., 8, Victoria Street, London, S.W.1, to state that the Zephyr motor attachment has been protected by grant of letters patent for the United Kingdom and abroad. An application has also been lodged securing patent rights of the stand illustrated in the issue of April 24th, which will be of service for Zephyr and other motor cycles fitted up by the Syndicate.

A Useful Scheme.

Messrs. Phelon and Moore are sending their representative, Mr. R. Lewis, to visit all towns where there are P. and M. agencies. He will be driving a standard P. and M. sidecar outfit, and will give demonstrations to prospective riders, give advice to present owners of P. and M. motor cycles, and help them with any difficulty which they may be experiencing.

This scheme is to be run closely on the service lines which exist in the car world, by means of which manufacturers help those who have purchased their vehicles for some considerable time after delivery.

The Creation of a New Industry.

We have received from Messrs. Thomson-Bennett Magnetos, Ltd., an attractive booklet containing some account of the creation of the magneto industry in this country after the outbreak of war. Before the war Messrs. Thomson-Bennett were the only makers of magnetos in England, and their output was negligible compared with present-day production. Our readers can obtain copies of this booklet on application to the above firm at Great King Street, Birmingham.

The O.K. Junior Flat Twin.

Messrs. Humphries and Dawes, Ltd., of Hall Green Works, Birmingham, have been very busy on special work in connection with Handley Page, Sopwith, and other makes of aeroplanes. They are one of the few firms who are being ordered to continue in this direction, and this will occupy a good section of their works for some time. However, they are busy completing the design of the new O.K. Junior horizontal twin $2\frac{1}{2}$ h.p. motor cycle.

From Tanks to Lighter Vehicles.

Maj. Frank Vandervell, who has just started in partnership with his brother Lt. Percy, under the name of "Vandys," as motor agents, etc., at Pembridge Gardens, Notting Hill Gate, was from 1902, and until the outbreak of war, intimately connected with the electrical firm of C.A.V. at Acton, of which his brother Charles is the head. He was mobilised two days before the declaration of war (being then a member of the Artists' Rifles), and served with distinction both in Gallipoli and France, first with the South Lancashire Regt. and then with the Tank Corps, of which he was one of the first six officers, and received his majority in January, 1917.

Catalogue Received.

Messrs. Douglas Motors, Ltd., Kingswood, Bristol, have prepared a new booklet describing their 4 h.p. model. This is a most interesting publication, which should strongly appeal to the many users of the 4 h.p. Douglas sidecar combination.

A meet of the Redditch M.C.C., composed chiefly of members of the staffs of the B.S.A. and Enfield Co.'s.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—First 12 words or less 2/., and 2d. for every additional word. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd., and crossed & Co. Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.**

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.4), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. 000, c/o "Motor Cycle," 20, Tudor Street, E.C.4. Replies to Box Number advertisements containing remittances should be sent by registered post.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged; when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR CYCLES FOR SALE.

A.B.C.

EARLIEST Deliveries of A.B.C.; book your order now.—Witham Bros., Newport, Wight. [1355]

A.B.C.—Caffyns, Ltd., Eastbourne, distributors for Sussex, are booking orders for earliest deliveries. [0016]

A.B.C.—Distributors for Scotland. Book your order now to ensure reasonable date for delivery.—Edinburgh Pioneer Motors, Ltd., 50, Grindlay St., Edinburgh. [X8301]

100, Gt. Portland St.,
London, W.1.

Dear Sir,

We thank you for your letter of enquiry for earliest delivery date of 1919 Motor Cycles.

We are sorry to have to disappoint you, but deliveries are coming through so slowly, and we have already booked so many orders, which must be dealt with strictly in rotation, that we are afraid it would only lead you to expect a machine at an early date if we accepted your deposit.

We think it best to be perfectly frank as to the position, and we are sure you will understand that, if we could help you, we should have been only too pleased.

If you care to consider a second-hand machine, we shall be glad to forward you our list.

Hoping to have the pleasure of supplying you at a future date,

Yours
faithfully,

MAUDE'S
MOTOR
MART.

Telephone: Museum 557.
Telegrams: "Abdicat, Wesdo, London."

IMPORTANT NOTICE.

Owing to the Whitsun Holidays, the issue of "The Motor Cycle" for June 12th must be closed for press earlier than usual. All copy and instructions for Miscellaneous Advertisements in that issue must, therefore, be in our hands not later than first post on Thursday, June 5th.

"Deliveries in Sequence."

In consequence of the limited output and spasmodic deliveries of motor cycles during the present "Reconstruction Period," we regret it is not possible to quote our clients more than approximate delivery dates. We are, however, able to assure intending purchasers that we are in a position to supply with a minimum of delay, as our contracts for all the most desirable machines are large, and were placed early enough to ensure preference. We shall be pleased to give the fullest possible information concerning the following, and if your order is placed with us, you will have the advantage of knowing that you will receive absolutely fair treatment, as we do not, under any circumstances, depart from our indelible rule of "Deliveries in Sequence."

Co-operation.

WHEN one spends £60 to £150 on a motor cycle it is probably the event of a lifetime, at least for many. Therefore it is not surprising that such purchasers should have definite views of their own requirements, such desiderata constituting what is generally termed "demand."

Now the people who should be in the best position to gauge this demand are the salesmen, because they know what the public asks for and are constantly in contact with experienced motor cyclists who are never loth to discuss the features of their previous mounts. It is, therefore, obvious that for this knowledge to be fully utilised there must be close co-operation between the designing department of the motor cycle manufacturing concerns and the men who sell their machines. This has frequently been done to a certain extent, and demands even anticipated, but there is also often a dormant demand the existence of which is not realised.

The public, and the motor cycling public particularly, likes to be educated, but in its own time and way. It is not particularly anxious to have anything forced on it, and this cannot be done except by tremendous effort. There has been too much tendency to introduce new essentials in construction instead of refining those already in existence. In spite of reconstruction, this is not an age of radicalism; it is rather a period of intelligent refining of essentials. We have the essentials that make up a successful motor cycle in various price limits. The problem is to make the things we already have better, more saleable; to recognise more what the public wants in the form of convenience, appearance, and cleanliness.

The designer is undoubtedly in a difficult and delicate position. He has to steer a medium course between the demands of production and the public desires. The public wants many things that the production department finds it impracticable to build. The sales department

does not want certain features on a machine for the sake of causing trouble in the production department. It wants particular features that, as shown by the experience gained in meeting the users and dealers who buy machines, are demanded.

Motor cycles are divided into classes according to the order of the five essentials of the successful machine: reliability, appearance, performance, economy, and price. Reliability should come first in all cases, and "appearance" covers mudguarding, etc. The other qualities take precedence according to circumstances.

The manufacturing end of the industry is constantly looking out for new developments in the engineering side; this is good, but we would like to see more attention devoted to the many things that can be refined.

Taxation of Miniatures.

IT seems absurd that, while the pedal cycle is free from taxation, a miniature machine fitted with a diminutive engine at once becomes subject to a tax of £1, and also entails registration and a driving licence.

We have frequently referred to the desirability of a reduced tax for such machines as motorised bicycles, and the need for some reform again becomes apparent now that several firms are seriously entering the industry with such auxiliary motors and "scooters."

If the pedal cycle is exempt because it is a machine used by the multitude for utilitarian purposes, then the case for motor cycles designed with a similar object should also be considered by the authorities.

It is suggested that a 50% reduction in tax should be made where a motor scooter does not exceed 2 h.p. and a weight of 80 lb.—a suggestion we commend to the notice of the A.C.U. and the A.A. for consideration in connection with their plans to combat any unfair taxation which may be suggested when the Chancellor of the Exchequer revises the present schedules.

IDEAS: Useful and Ingenious.

Gray R Jones.

An Amateur's Cush Drive.

A HOME-MADE shock absorber on a chain-driven machine was made as follows: Four small brackets were bolted to the rear wheel rim as shown—two on each side, each pair being connected by a rod which carries two stiff coil springs. The chain wheel, instead of being attached to the spokes, is carried

An easily-made shock absorber.

on a disc which has two arms projecting almost to the rim. At their extremities a loop is formed, which passes round the rod between the springs. It will be seen that the drive must of necessity be taken, via the arms, through the springs, with consequent saving in tyre wear.

A Saddle Improvement.

ACCORDING to Mr. F. G. Ratcliff, of Birmingham, the ordinary saddle can be made very much more comfortable, especially for long-distance riding, by making a felt pad as follows: Procure a piece of felt half an inch

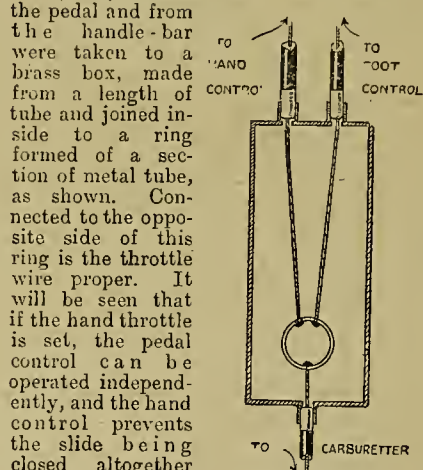

Adding comfort to the saddle by the addition of a felt pad.

thick, and cut to the shape of the saddle, and sew thinner pieces in a semi-circle round the back to make it thicker there. Then cover the whole with American leather, which will make it waterproof. It is secured to the saddle by wires—tapes are not strong enough—one over the peak and two at the rear. The additional thickness at the back provides a better shaped seat than the standard saddle.

Readers of "The Motor Cycle" are invited to contribute to this page any ideas successfully adapted to their motor cycles. Contributions will be paid for at our usual rates. Rough explanatory sketches will suffice

Dual Throttle Control.

THOSE who favour pedal control of the throttle will be interested in the device fitted by Mr. E. H. Craig, of Newcastle, to his machine. The wires from

Foot control in addition to handle-bar control for the throttle.

Cleaning Off Enamel.

MANY ex-members of H.M. Forces will be acquainted with the disinfectant known as Creosole. Creosole, if used in its neat state, has the effect of cleaning all enamel from an article. The instructions are very simple. Apply the liquid with a piece of waste to the enamel which it is desired to be removed.

Apply thickly, and allow the fluid to soak in for about half an hour. After the expiration of this time the enamel will have crinkled up. This can now be removed with the aid of a piece of waste. The crinkled portions will wipe off quite easily, but in the case of any small patches remaining, these can be removed by a slight rubbing with waste soaked

in Creosole. The surface will be free from scratches to spoil the effect of re-enamelling.

One must be careful to clean the Creosole from the hands as soon as possible. The English equivalent to Creosole is Jeyes' fluid, but any Creosole-base disinfectant will do.—W. A. EGGINGTON.

Extra Air Valve.

MR. L. R. CUTLER, of Birmingham, has made a useful extra air valve, particulars of which are here given. The valve was made for use while running on benzole, and has proved very useful, especially so because a fine adjustment is provided. The body is turned and bored out of a piece of brass, and the

A simple extra air valve.

valve made from a small bolt with the head tapered slightly to make a good joint with the seat. A light spring is slipped over the stem to open the valve when the nut, which is off a plug terminal, is unscrewed. An ordinary spring clip is attached to the valve body by small screws and soldered, which holds it firmly to the induction pipe.

Induction Pipe Warmer.

TO facilitate easy starting up in cold weather, Mr. G. R. C. Spencer, a Kent reader, utilises the device illustrated. A holder is made from a small tin, to the bottom of which an acetylene burner is attached. Air holes are drilled in the bottom round the burner and also in the sides, and a wire clip is made to suspend the whole from the induction pipe. When required for use, the tube from the generator is connected up and the gas lit, which soon raises the pipe to the required temperature.

A unique method of warming the induction pipe for starting purposes.

American "Service."

MY comments of May 15th have provoked quite a barrage of private correspondence, some of it reasoned and some of it acrimonious. The enthusiasts for the big Yankee twins either state or betray three main reasons for their partisanship. On the first point they are all agreed, viz., that for courteous, efficient, and businesslike "service," the importers usually have the home manufacturers beat to a frazzle. The second ground for adherence to the foreign makes is technical—one engineer sends me a closely reasoned claim that the Americans are superior in design and workmanship to our best products. The third factor is non-arguable, irrational, and feminine, but intensely valid—it is simply "I don't know why I luv you, but I do, do, do."

Maker and User.

SO far as "service" is concerned, I am and must remain a thorough-going ignoramus, for, if a firm supplies my wants promptly and generously, answers my letters by return of post, and treats me decently if a legitimate grievance arises, I cannot safely assume that an unknown private owner at home or overseas would inevitably receive similar consideration; he might, or he might not. But I can assure our home makers that there is a remarkable unanimity amongst correspondents to the effect that you should buy an American if you want to be petted and nursed; and eke that there is a deep and sturdy body of resentment at the manner in which some British firms treat their customers. I will quote one or two recent cases in point, without being guilty of the fallacious suggestion that they are typical. Some months ago I personally ordered a leading British machine. The other day I wrote and asked if the firm could state an approximate delivery date. For ten days I heard nothing; then a curt letter arrived, obviously dictated after a most cursory and unintelligent glance at my query, stating that if I wanted an X—, I had better apply to the local agents (whose name and address were not mentioned). Or, again, the other day a demobilised pal of mine bought a 1913 Indian and sidecar, much against his will, impelled by the fact that it was the only tolerable machine available at his price. He bought it with qualms, and assumed rather an apologetic attitude when mentioning his choice. I am not going to say he had no trouble with it—what can you expect with a 7th-hand six year old? But "service" has converted him into a pro-Yankee of the purest water. When he called at the London depot—which must have been carried on at a heavy loss for several years—he was greeted by an exceptionally intelligent girl, who promptly handed out the required spares across the counter, and that at a rational price. Or, again, a demobilised doctor tells me that he wrote to several British firms on donning civvies, and got replies of the "don't bother me" order: in several cases he made further enquiries, and got no answer at all.

The deduction is obvious. That a number of British firms give "service" of a super-American type is not sufficient. If *all* the importers give A₁ service, and only 10% of the home makers give C₃ service, an impression will be created that for courtesy and good business methods you must buy foreign stuff. The surly, haphazard, exploiting type of maker is not merely a bankrupt in embryo or an irritation to the unfortunate riders who tumble into his maw. He is an incubus to the entire British trade, and ought to be blacklisted by the firms who supply raw materials and accessories, by the shows, and by the trials.

An Engineer on the Americans.

IT is only fair to state both sides, and a technical correspondent takes the following line: "I think Americans in general make better engineering jobs from start to finish. The balance is better, the cam gear is more silent, and the slow running is superior, since the inlet pipe does not require lagging with insulating tape. The weight of the reciprocating parts and the bearing surfaces compare favourably with home practice. The finish of the engines is above reproach, and all spares are a dead fit. The engines wear well, whatever they used to do. Referring to my —, can you name a better hub adjustment, a spring fork with more lateral rigidity or better provision for taking up wear, a better clutch, steering head, etc., etc.? The detail work is simply excellent. Felt-lined chain case—no rattles, and removable in three minutes. A fall does not weld foot-rest spindles to frame. The carburettor gives 85 m.p.g., is adjustable from the saddle, is proof against airleaks, and has a jet which cannot be fouled. Finally, the machine will do from 11 to 70 m.p.h. on top gear." If these claims are facts, they are, of course, unanswerable.

I deduce that the Americans have been steadily growing better and better at a high rate, and that their 1919 models constitute a very serious proposition for our own trade to tackle. Wherefore I repeat my warning of May 15th: Let the British trade establish a reputation for class in big twins and good service before the tariff comes off.

The Weight of Solo Mounts.

ANOTHER correspondent takes exception to my suggestion that three hundredweight is an excessive weight for a solo machine. Of course, I freely admit that 8 h.p. Britishers run quite as heavy as any American 7-9 h.p. My point was that three hundredweight was a ridiculous figure for solo machines, irrespective of nationality. So long as unsprung frames were the rule, machines which exceeded two, or possibly three, hundredweight were emphatically the goods for long distance work. Lighter machines joggled you up badly and roughly, in proportion to their lightness. 200 miles on a lightweight spelt torture; a similar distance on the best

Occasional Comments.—

2½ h.p. machine was tedious; on a two hundredweight machine, with a 3½ h.p. engine, 200 miles did not represent an effort; and the double century on a three hundredweight striding twin was positively enjoyable from start to finish. But the spring frame has changed all that. Even now there are comparatively few spring frames on the road; some of them chiefly serve to elucidate the faults of front forks, which were once unsuspected; others are bad at both ends; and only a few are genuinely satisfactory under hard wear. But the spring frame has washed out the old necessity for a very heavy mount as an essential of comfortable riding, and modern engines can provide the necessary "pep" without undue bulk. I am open to conviction as events develop; but I am quite distinctly and unashamedly of the opinion that a weight of three hundredweight and an engine of 1,000 c.c. will strike the solo rider of the near future as laughable.

If You Don't Have to Push It.

Of course, I am eating my own words—not for the first time. In the early days of the motor cycle, there was a "light v. heavy" controversy. The light brigade wrung their hands, pointed out that the first imported Werners and Minervas weighed one hundredweight or whatever it was, and that misguided Britishers were inflating motor cycles into unwieldy monstrosities with incredible horse-powers (2½ h.p. was the limit in those days). I used to opine that the weight did not matter so long as it propelled itself, and that the real point was to get a reliable runner and a good climber. The claim was true, and we pushed weight up to over two hundredweight and horse-power up to 3½ h.p. nominal. Then the Americans chipped in, and extended the process to the three hundredweight 12 b.h.p. line. Now, I fancy, we shall see the process reversed. The medium-weight will develop until it can do all we want, and finally the pukka lightweight, which no man living has ever seen, will annex half the solo market. After all, weight does matter—it always mattered. It had to yield to reliability, to climbing, to comfort, and to speed. Given those things, no sane man is going to carry an ounce more than is necessary. The heavy machine costs more to buy and to run, and it is always unwieldy to handle, whether "handling" means getting it out of the garage or pushing it to the nearest railway station. One of the main interests of the next two years consists in the fact that we shall be offered machines scaling well under 2 cwt., which will do all that seventy-five per cent. of our riders ask.

The Pioneer in Weight Reduction.

Of course, the Douglas people were the real pioneers in this line. When their first 350 c.c. engines appeared, they represented a definite challenge. Avoiding the pitfall of the featherweight ideal, which was then—as now—impracticable, they said in effect, "Why do you fellows lug so much unnecessary weight about with you? We are cheaper and lighter than your present mounts, but they cannot slip us uphill or on the flat, and they cannot give us any start in reliability or comfort." It just was not quite true, but it was so nearly true that in a year or two Douglas was established as one of the select coterie of best sellers. In 1920, or possibly earlier, one or two machines, including the Douglas and rivals which embody its principles, will repeat that ancient challenge, and every word in it will this time stand analysis. The smaller engine will give the required power, and evince the full standard of reliability. The economy will be there, and the comfort. Youngsters may continue to lug round one or more unnecessary cwt.s., but women will not, neither will men over thirty years of age. Weight reduction is a prime factor in the open market; and the firm which ignores the point will live to regret it. I go so far as to think that the production of a single first-class scooter would eat deeply into the motor cycle market, for thousands of people use their machines simply as short-distance conveniences. If you can get the work done by a machine scaling 100 lb., costing £30, and doing 150 m.p.g., why go in for 220 lb., £80, and 75 m.p.g.?

Incredible?

THE old yarn of the £10 Ford motor cycle was on the rounds once more last week. The daily press had the story again as usual without foundation. As we cannot get a push-bicycle, even of the gaspipe order, at such a figure, the story is obviously absurd. But I am perfectly prepared to credit that Ford can and will market a very usable motor bicycle at £25 if the fit takes him. It will not weigh 3 cwt. It will not develop a brake-horse-power running into double figures. But it will not sell a penny the less readily because of these peculiarities, and it would cause a very perceptible slump in the value of urban cottage property. After all, it was rather absurd that in 1914 in Detroit you could get a 20 h.p. five-seated car of very decent quality for £77, and that the cheap two-wheeler of any class obtainable in the same city cost over £50. This particular anomaly has never been realised over here, for the simple reason that this country has yet to produce its first really cheap car.

Mr. Trevor T. Laker, a well-known competition rider before the war, who is starting an aeroplane passenger service at Nuneaton at Whitsuntide.

176 Entrants for the London-Edinburgh Run.

Official List of Entrants, their Numbers, and Starting Times. Some Hints to Competitors. Catering Arrangements. The Course Described.

TO-MORROW evening (Friday) will see the start once more of the famous London-Edinburgh run, the popular event which the Motor Cycling Club ran every year without a break from 1904 to 1914. Now, after five weary years, this classic event will take place once more, and at 9 p.m. of the 6th inst. 176 competitors will start at half-minute intervals from the Old Gatehouse, Highgate, for their four hundred miles trip northwards.

Mr. H. J. C. Spring, proprietor of Ye Olde Gatehouse Hotel, Highgate, has undertaken to provide supper for competitors from 6.30 to 8.45 on the evening of the start. He is also prepared to fill vacuum flasks with hot coffee and to provide sandwiches to take away. Naturally, it will greatly facilitate his arrangements if those who desire supper, coffee, and sandwiches will notify him, so that he will know for how many to provide. Mr. Spring's telephone number is Hornsey 168.

This year there will be coffee and sandwiches at Biggleswade, the first stop, where are excellent foundations for the dreary drive through the hours of darkness; and the same fare will be on hand at the garage at Grantham.

In such places as York (second "breakfast") and Carlisle (lunch) it will probably be a case of first come first served, and the solo riders will (as it is right they should, since they have no accommodation for luncheon baskets) most likely score. All alcohol should be eschewed during the run, though perhaps a light wine at dinner before the start will do no harm.

The most important advice to competitors is that they should not forget to wind up and set their watches before the start.

The secretary of the A.A. has placed the A.A. road scouts at the disposal of the committee, so that the route should be well marshalled.

For the first time in the history of the London-Edinburgh run, thanks to the Daylight Saving Act, the competitors will start in broad daylight, and enjoy over an hour's run before it is completely dark. This will take them to Hatfield. Thereafter, the road is good and practically flat to Biggleswade. In the dark portions there are one or two awkward places, but these are usually marked by willing helpers with lamps shining or arrows. The first of these is in Baldock, where at the end of the wide main street competitors turn right, and then sharp left, after which there follows a wonderfully straight road right to Biggleswade. On entering the town competitors bear to the left, then proceed straight on, and pull up at the Swan Hotel. On leaving the town they bear sharply to the left over the river Ivel, and then strike northwards for Girtford, where the main road turns very sharply to the right over the Ivel. This is quite a dangerous spot, as the turning comes quite unexpectedly in the dark.

After this the course is straight forward to Tempsford, and about half a mile from this village the main road bears sharp

left, and it is quite easy to go straight on into St. Neots and Huntingdon unless the rider is careful. Here the left-hand road should be taken and the River Ouse crossed, after which competitors have no

This and the following page form a USEFUL GUIDE to Competitors and others interested in the London-Edinburgh Run, and we suggest that this copy of "The Motor Cycle" is carried by all who follow the event.

cause to worry, and a long easy run over straight road ensues to Wansford. Tomorrow the moon is one day over the first quarter and sets at 2.3 a.m., and so, given fine weather, the night portion of the trip should present few terrors to newcomers, who may be comforted by the fact that members of the committee, who know the road well, will be riding in front and will lead the way.

By means of the moon chart, reproduced here, and which is published by Messrs. C. A. Vandervell and Co., competitors can see at a glance that they

only have about three hours complete darkness. The sun sets just after the start, and it is not dark till one hour later, though lamps should be lit half an hour after sunset, and the moon will shine till after 2 a.m. The sun rises about a quarter to five, and so it should begin to get light at 3.45 a.m.

The Entrants and their Official Numbers.

	Time of Start.
1. Cooper, W. (2½ Douglas)	9 p.m.
2. Baddeley, L. A. (2½ Douglas)	9.0½
3. Olsson, V. (4 Douglas)	9.1
4. Sproston, A. J. (3½ Lea-Francis)	9.1½
5. Moffat, P. W. (3½ Douglas)	9.2
6. Boileau, E. M. P. (3 A.B.C.)	9.2½
7. Robbins, A. C. (2½ Wooler)	9.3

106. Tippet, N. P. (4 Rex)	9.52½

A HEAVY TWIN AS A SOLO MOUNT.

Some Personal Experiences with a "Victory" 8 h.p. Matchless.

ALTHOUGH there are hundreds of heavy twin sidecar outfits on the road at the present time, it is comparatively seldom that one comes across a heavy 1,000 c.c. twin, primarily designed for sidecar work, that is in daily use as a solo mount.

At the end of 1918 a lucky chance enabled the writer to pick up a practically new Victory model Matchless combination at a moderate price, which bargain was eagerly snapped up, and this somewhat extra-heavy motor cycle, built originally for machine-gun service in Russia, has since been ridden solo over 1,500 miles.

During this distance not a single mechanical failure has been experienced, and, with the exception of three or four punctures, all has gone well.

The sensation of bestriding such a heavy machine, fitted with 700 mm. x 80 mm. Hutchinsons (not blown up brick-hard), must be experienced to be realised.

Easy to Ride.

When once in the saddle, the motion from 4 m.p.h. to 50 m.p.h. is quite perfect, and, were it not that this particular machine is much under-geared for solo work, this latter speed could be easily bettered by 20% without detriment to one's personal comfort.

The gear ratios are approximately 5 to 1, 7½ to 1, and 12 to 1, so that it will be seen the 1,000 c.c. J.A.P. would, if necessary, lug the machine up a mountain side on the low gear; and it is comforting to think that the machine will climb anything, provided the back wheel can get a grip.

The steering and general balance are excellent, and these do not appear to be affected by either speed or road surface.

Of late the roads (!) within a thirty miles radius of London have been thoroughly explored: the condition of these "tracks" must be personally tested to be fully appreciated.

Heavy to Push.

The road between Acton and Uxbridge, and for five miles beyond the latter town, easily wins the first prize, it being impossible to remain on the saddle for stretches of one hundred yards at a time. These bits had to be traversed by pushing the Matchless (and luggage): no light task.

However, good, and even excellent, roads are still to be found, especially in the Midlands; and on these the entire absence of vibration and rattle makes the heavy machine a real joy to handle, and does away with any sensation of fatigue, even after the longest journeys.

The 8 h.p. Matchless, which the owner used as a solo mount for 1,500 miles.

Of recent long distance trips, a run from Coventry to Eastbourne (162 miles), *via* Oxford, Reading, and Horsham, in six hours is a good example. This journey was undertaken on a Saturday afternoon "against time," as it was impossible to start before 2.30 p.m., and only two stops were made for replenishments *en route* (Wallingford and Horsham).

Average Speeds.

Though a high average speed is possible on a machine of this description, perhaps the speediest trip was from Warwick to Banbury in the early morning, a distance of nineteen miles, which was covered in under the half-hour. This particular road is excellent, and but for a couple of cows, nothing impeded the speed which at times was a trifle alarming.

As a matter of fact, the pace was maintained as far as High Wycombe (a further sixty-five miles), which was reached in 1h. 40m. from Banbury.

The comparatively low top gear considerably assists the average speed on long trips, and enables a sidecar to be towed without much difference in maximum speeds, except, of course, on steep hills which, solo, the machine would naturally romp up on top.

The highest speeds so far registered by the Stewart speedometer have been 52 m.p.h. (solo) and 44 m.p.h. with the sidecar; but, to prove that a good average can be maintained with full load, a run of 102 miles, between Stamford and London, was accomplished with a fourteen-

stone and rather frightened passenger in four hours exactly, and this with a pile of Easter holiday luggage.

M.P.G.

The petrol consumption works out at about 55 m.p.g. solo, and in the neighbourhood of 40 m.p.g. with a sidecar, though this could be improved considerably if the writer was willing to sacrifice the remarkably slow running quality of the carburetter for the sake of adding a mile or two extra to the gallon.

To sum up, for an enthusiastic rider the heavy twin for solo work scores every time, but naturally does not recommend itself to any but the somewhat muscular motor cyclist. For this type of rider nothing could be better than the big Matchless. The sensation of overtaking and sweeping past another machine, on a hill especially, is one of the most satisfactory of motor cycling experiences, and is partly responsible for the writer having become an ardent advocate of the big twin for solo work.

B.

READERS' ROAD REPORTS.

A SELECTION from the many road reports received from readers is given below:

YORKSHIRE.—Middlesbrough to Saltburn: This road is now being repaired, but stretches are still in a shocking condition. Middlesbrough to Sunderland: By the transporter bridge this road is fair as far as Ryhope, whence into Sunderland it is very bad. Sunderland to Newcastle: This road is very bad indeed. The East Boldon to Sunderland stretch has been renovated in places, but is getting cut up again by the heavy traffic. Middlesbrough to

Darlington: Bad to Stockton; thence good to Darlington. Middlesbrough to Whitby: Not very good to Guisborough; thence not bad. Practically all the roads near and around manufacturing centres like Middlesbrough, Sunderland, South Shields, Stockton, etc., are very bad indeed. Away from these the roads are, on the whole, not bad.

Farnham to Plymouth: The Winchester-Salisbury road is very good. There is a bad patch on the Sherborne side of Yeovil, just outside the town, and others on either side of Shaftesbury, but none of them

serious. A road to be avoided by motor cyclists is the one from Chudleigh to Kingsteignton, en route for Newton. Entering Plymouth, the road following the Plym, from Laira Bridge to Plympton toll bridge, should be avoided and the town entered from the north-east via Mutley Plain. With the above exceptions, the roads on the route, Alton, Winchester, Salisbury, Yeovil, Chard, Honiton, Exeter, Chudleigh, and Totnes, are surprisingly good.

Glen Eagles (Auchterarder to Murchart): This road is practically impossible now for motor cycles.

THE ARBUTHNOT TROPHY.

Competition Rules and Details of a Sporting Naval Event Next Month.

WE are now able to publish particulars relating to the Arbuthnot Trophy trial, to be held under the competition rules of the Auto Cycle Union on Friday and Saturday, July 4th and 5th. In framing the rules the A.C.U. Competitions Committee has endeavoured to promote a sporting event which would have appealed to the gallant officer whose name the trophy bears. It is intended that a similar trial, or some other form of competition, shall be held annually, the holder of the trophy being eligible to compete free of entry fee. The trial this year will occupy two days, and the total distance will not exceed 250 miles. The start and finish will be at Plymouth.

General Conditions.

It may be remembered that this important competition, which is quite unlike any other which has ever been held, was the outcome of a suggestion made by *The Motor Cycle*, which was instrumental in collecting the fund for the purchase of the trophy, and in getting it executed by Lady Scott, the widow of the famous explorer.

Although it had been finally decided that the trial should be open to any officer in H.M. Navy, at the last moment the Competitions Committee of the A.C.U. also made it open to any officer of the Royal Naval Reserve, or Royal Naval Volunteer Reserve, on the active service list on the date on which entries close, which is 5 p.m. on Monday, the 23rd inst. Each entry must be accompanied by a fee of one guinea, and if the entrant is not already on the competition register of the Union, by the application for such registration, the fee for which is 5s., or, in the case of a member of a club affiliated to the Auto Cycle Union, 2s. 6d.

The course each day will be between 100 and 150 miles in length, and details will be published the day previous to the trial. A competitor may not leave the

course under any circumstances, and may be disqualified or otherwise penalised should he do so.

Competitors' motor cycles must be driven under their own power only throughout the trial, during which their road wheels may not be brought to rest under any circumstances whatever, except for exigencies of traffic and at the official controls. Pedalling or running alongside is prohibited, as is kicking on the ground for purposes of propulsion. Outside assistance, or assistance by another competitor, is forbidden.

The maximum time allowed for a competitor to cover each section will be that requisite for an average speed of 18 m.p.h., whilst the minimum time allowed shall require an average speed of 20 m.p.h., allowances being made for ten-mile limits, difficult country, etc. Arrival times will be taken at the finish of each section only, namely, at the luncheon control, the test hill, and finish each day. The earliest and latest times of arrival at all important points will be shown on each competitor's route card. There will be no secret checks.

THE ARBUTHNOT TROPHY.

Designed and executed by Lady Scott, and subscribed for by the motor cycle public to perpetuate the memory of the late Rear-Admiral Sir Robert Keith Arbuthnot, Bt., K.C.B., M.V.O., who gave his life for his country at the Battle of Jutland.

Any competitor not ready to start at the appointed time will be disqualified. The order of starting will be by ballot each day, and the first competitor will start at 8.30 a.m.

Throughout the trial, no adjustments, repairs, or replenishments of any competitor's motor cycle, including repairs or replenishment of tyres, may be carried out, except that a replenishment of oil, petrol, and water is permitted during the luncheon control.

Efficient silencers must be fitted, and any competitor who, in the opinion of the stewards, fails to comply with this regulation will be disqualified.

Defining the Winner.

A "consistent driving" test will be held on the same hill each day, the ascent of the hill being part of the route of the trial. The hill will be divided into two parts, the first part to be climbed at an average speed of not more than 10 m.p.h., and the second part at an average speed of not less than 15 m.p.h. The difference between the time taken by a competitor to climb the slow and the fast parts of the hill respectively will be noted each day, and the competitor who most nearly repeats on the second day his performance of the first day shall be adjudged the winner of this test.

Every competitor who completes the trial according to these regulations will be awarded a silver medal, and the trophy will be held by one of the medal-winners who makes the best performance in the consistent driving test.

If no competitor succeeds in completing the trial according to these regulations, the competitor who makes the fewest number of involuntary stops will hold the trophy, or if such number of stops is the same for more than one competitor, then, of these competitors, the one who makes the best performance in the consistent driving test.

Plain Talk to American Motor Cycle Manufacturers.

VERY often British motor cyclists point to American machines as being a standard which manufacturers should aspire to obtain for colonial models. It has been said that the average British machine is too light for service overseas, yet an American dealer appeals to makers in the United States to make their machines lighter.

"Now think a minute," he says. "In 1912 we had some real motor cycles, lots of power, light in weight, and could handle them without letting them fall on us and break a leg. The small man mastered his machine, and now it takes a husky 'six-footer' to ride one."

"Let us sit in a comfortable position and not with our knees up under our chins, with all our weight on the saddle and our feet up alongside the front wheel."

"Now for a sidecar. Let's have a slow-speed motor, about 1,150 c.c., low compression, one that will run standing

still for a few hours without burning up, and cut the speed all out. Just let it pull a sidecar 40 m.p.h., and keep doing it! and a frame for sidecar work only, no spring frames. You wouldn't have springs on one side of your car at the rear end; this throws you out of balance. For sidecar work, your rear wheel doesn't set up straight now. Give us a lot of clearance for mud chains, a waterproof magneto, and spark plug connections that will stand a splash of water; a front guard that will keep us from getting drowned when we hit water. Make it entirely different from anything you now have. Give us a front fork with rocker arms and pins that won't have to be replaced every thousand miles. Give us a transmission for sidecars—one that won't strip and get out of order. If you can't build three speeds right, give us two speeds that are right. Give us sidecar clearance as much or more than a

'flivver.' If this outfit costs as much as a 'flivver,' let's have it. Then we could go when we wanted to, and get back and run so much cheaper than we do now. Remember this sidecar motor and machine is to be for sidecars only.

"Now, Mr. Manufacturer, your high-salaried men who design these two-wheelers sit in soft chairs and ride in Packards, and have a line of argument that would make a common motor cycle rider get down on his knees and ask to be forgiven for what he mentioned about improvements; they know, course they do! They draw from five to ten thousand a year, and do what the directors tell them to do in order to make big profits, and keep from changing any machinery. But, nevertheless, keep an eye on Henry Ford; he got by nicely, and you all laughed at his product in 1908. Ten years later he couldn't spend all of his money—because he made it in quantities."

Sidecarring with a 400 c.c. Flat Twin.

First Impressions of the A.B.C. Sidecar on the Road.

SO much interest has been displayed in the A.B.C. motor cycle, which hitherto has been seen by the majority only on paper, that some further details of its running are certain to be welcomed by our readers.

During a recent week-end we covered ninety miles solo and some seventy-five miles with a sidecar on a machine which is the prototype of the production models which the Sopwith Co. will launch on the market.

This early model, though it possesses certain faults which, we understand, will not be present in the later types, would satisfy the most critical motor cyclist.

These difficulties are a bad carburetter, which refuses to fire regularly under 17 or 18 m.p.h. on top gear and remarkable oil slinging propensities. In the later models a new carburetter will be fitted, and an improvement made in the crank case design, which will remedy the other trouble.

We drove the machine home without a passenger in the sidecar, and found that even over quite rough surfaces the outfit held the road extremely well. The sidecar, though not a luxurious affair, is of medium height, and comfortable, not because of the soft padding of the cushions, but owing to the excellent springing of the axle, which is mounted on quarter elliptical springs while the body is fixed on C springs.

Our first surprise came when we climbed a long and trying hill on top speed at 36 m.p.h. over the crest, and realised that the little 400 c.c. engine had made an

The 3 h.p. A.B.C. with a sidecar fitted with a sprung axle.

ascent equal to that of a 30 h.p. Lancia car which we had driven over the same road a week or two before.

40 m.p.h. with Sidecar.

Later the same evening we took a passenger for a short trial spin, touched nearly 40 m.p.h. on a slight up grade, and climbed a hill of average steepness at 30 m.p.h. On the return trip 42 m.p.h. was attained. The next day we drove the machine with a passenger over various by-roads in ordinary undulating country, and never used a lower speed than third, but we finished up with the impression that the 3 h.p.

A.B.C. laden with one passenger and luggage will go practically anywhere in Great Britain, and be capable of climbing such hills as Birdlip or Sutton Bank under these conditions. Would that either had been close at hand so as to make the attempt! No matter how severely the engine was abused, it was impossible to make it knock, no matter whether the spark was fully advanced and the throttle suddenly opened on a hill.

The next day we removed the sidecar, and drove the machine up the Great North Road as far as Buckden. The surface was good on the whole, but where ordinary pot-holes occur these are hardly noticeable, so excellent is the springing, which with the Brooks saddle renders the A.B.C. luxuriously comfortable, there being an entire absence of unpleasant "rebound."

The Machine Criticised.

The steering is good on the whole, but wider handle-bars would, we think, be desirable, as the steering at low speeds was not very steady. Critics who have not tried the machine have suggested that with the machine set across the frame cornering would be difficult. This we did not find to be the case, as ordinary curves in the road could be taken at a good swinging pace. Needless to say, the engine is, to all intents and purposes, vibrationless, but the valves are a trifle noisy. Doubtless some of the noise could have been eliminated by careful tappet adjustment, but on the whole we are inclined to think that the slight clatter is the penalty of efficiency—a fault found in many motor cycle engines.

We are greatly looking forward to a closer acquaintance with the production model A.B.C., with its new carburetter, improved crank case, tool box under the footboards, and Lucas dynamo lighting set.

A.B.C. double-sprung sidecar chassis.

MOTOR CYCLING AND HEALTH.

THE fact that large numbers of doctors use motor cycles for their rounds is in itself a proof that the motor bicycle is a means of locomotion which can do no physical damage to the ordinary individual. In nine cases out of ten, if any doctor advises a man to give up motor cycling he is not a motor cyclist himself, and the advice of a doctor who is one should be sought before the idea of the patient riding a motor cycle is given up.

There is no doubt whatever that motor cycling is just as healthy an occupation

as exists. It is a means of getting fresh air, and of invigorating both body and mind, and is the greatest benefit to the worker in the town; but there is just one point to which the attention of the beginner should be called.

Many men, especially those who are just emerging from the prime of life into middle age may find that the first few miles on a motor bicycle or motor cycle and sidecar will cause various aches and pains, and a certain amount of fatigue, which may frighten him from continuing the pastime. The reason for these aches

and pains is not far to seek, and they are not serious. They simply mean that the riding of a motor bicycle brings fresh muscles into play.

Those who think of giving up motor cycling because they have suffered after a first ride should try to bear in mind the agonies of a man who has once ridden a horse, then given it up, and taken to it again, and his sufferings after his first ride. These are not to be compared with the paltry aches and pains that the unpractised motor cyclist may be called upon to experience. AILETTE.

CURRENT HAT

Times to Light Lamps.

SUMMER TIME.

June	5th	9.41 p.m.
"	6th	9.42 "
"	9th	9.44 "
"	11th	9.46 "

Summer Number on June 19th.

A fortnight hence, a special Summer Number of *The Motor Cycle* will be published. Definite orders should be placed with newsgents.

The Oldest Motor Cyclist.

We personally know a motor cyclist over sixty years of age. Others of mature years are to be seen on the road, and it would be interesting to know who is the oldest motor cyclist. Will these young-old riders send their photographs and brief particulars of their experiences?

Speed Limit.

Active co-operation by motorists using the Exeter-Plymouth road near Chudleigh is solicited by the R.A.C. in opposing the application for a ten-mile speed limit made by the Devon County Council, and now before the Local Government Board.

M.C.C. Team Trial for "The Motor Cycle" Cup.

The Motor Cycling Club has fixed a date in September for the inter-club team trial for the fifty-guinea cup presented for this purpose by *The Motor Cycle*. There is every prospect of this competition being held, provided there is sufficient support from the clubs.

Secretaries of motor cycling clubs who are able to send a team to compete in this popular competition are requested to communicate with the secretary of the M.C.C., Mr. Southcomb May, 34, Gower Place, London, W.C.1.

The P.S.M.C.C. and the Arbuthnot Trophy.

Naval officers who intend entering for the Arbuthnot Trophy are reminded that, if they are members of a club affiliated to the Auto-Cycle Union, they are entitled to be placed on the A.C.U. register of competitors at half fees, a procedure which is necessary, as the competition is counted as an open trial.

A suitable club affiliated to the A.C.U. which they may care to join is the Public Schools Motor Cycling Club—secretary, Mr. H. B. Browning, R.G.A., River Bank, Staines.

Officers who were educated in the *Britannia*, at Osborne, Dartmouth, or any of the recognised public schools, are eligible for membership of this club.

London-Edinburgh Run.

Readers who desire to see something of the London-Edinburgh run will find much useful information in this issue of *The Motor Cycle*. They should carry a copy with them.

Spectators who turn out during the hours of darkness to cheer the competitors on, should turn their motor cycles so that their lamps face northward. There is nothing more disconcerting to competitors than to meet motor cycles with head lights which shine directly into their eyes.

Petrol Tins.

Some curious situations are arising from the increase of charge for spirit cans to 3s. Some dealers insist on 3s. for every can, new or old, while others only charge the new price for cans stamped with that figure. An instance brought the state of confusion existing to our notice. Purchasing a tin of spirit, the garage proprietor offered us an unmarked tin for which he wanted to charge 3s. We offered him a tin in exchange, but he would only allow 2s. for it. Fortunately, it was a tin which had been sold us the night before by his man, who confirmed our statement with satisfactory results. It would appear that some definite ruling on the matter, however, is necessary.

Special Features.

GUIDE TO THE LONDON-EDINBURGH RUN.

THE HEAVY TWIN AS A SOLO MOUNT.
TWO NEW SCOOTERS.

Beware near Chislehurst.

There is considerable police activity round Chislehurst, the police being very keen on securing summonses for inefficient silencers, and also for exceeding the speed limit. The traps are worked on the Royal Parade and on the main road.

Fighting Unfair Trading.

The solicitors to the A.C.U. obtained judgment for the full amount claimed from a motor dealer who, having already sold a machine, effected a resale of the machine which he was supposed to be keeping for the original purchaser. The A.C.U. endeavoured to obtain a second-hand machine of similar make for the victimised purchaser, but found this practically impossible, and therefore ordered a new machine. Thus, the defaulting dealer was given a deserved lesson on the danger of profiteering and sharp practice.

Since the removal of petrol restrictions motor cycling has again become very popular in the navy. In a large ship the machine can be kept on board, and even ridden round the quarter-deck for testing purposes. This photograph of a Douglas owner was taken aboard H.M.S. Barham.

A Midland Rendezvous.

The George in the Tree Hotel at Berkswell is well-known to Midland motor cyclists, who will be interested to know that it has been taken over by Lt. A. Milner, the competition rider, who intends making it a high-class motor cyclists' rendezvous.

Police Traps.

There is a police trap at the foot of Harrow Hill on the Sudbury side. The gradient is rather stiff and riders of single-gear motor cycles must rush it and are consequently caught.

Motor cyclists are being stopped in Hounslow to see if their machines are properly equipped with two brakes, that the number plates are of the correct size, and that the silencers are efficient.

A £25 Miniature.

We have received preliminary particulars of a small machine known as the Motocyclette, sold at £25 by the United Industries, 26, Ludgate Hill, London, E.C.4. This consists of a motor attachment fitted to an ordinary pedal cycle. The power unit is a 1 h.p. two-stroke engine, fitted with a Wizard damp-proof magneto, Sentinel carburetter, handle-bar control, 3in. cord leather belt drive, hub and rim brakes, and a petrol tank holding 1½ gallons of fuel. It is designed for a speed of twenty-five miles an hour, and is claimed to do 100 miles to the gallon of fuel. The cost of the unit excluding the bicycle is £17, and it is claimed that it will fit any pedal cycle without brazing lugs or to altering the frame.

Birmingham - Land's End Trial.

THE following entries have been received for the Lycett Trophy two-day event during the coming week-end:

E. Kickham (3½ Sunbeam sc.)
G. Kuhn (2½ Lewis)
F. J. Watson (3½ Ariel sc.)
A. H. Johnston (2½ Allon)
C. H. Arkwright (2½ New Imperial)
E. R. Troward (2½ Metro)
E. Henrie (2½ New Imperial)
W. A. Bown (2½ Bown-Villiers)
S. Wright (3½ Humber)
R. W. Duke (4 Triumph)
M. G. Silver (4 Quadrant)
T. Silver (8 Quadrant)
S. Rodway (4 Norton sc.)
G. A. Dalby (4 Triumph)
G. A. Dingle (4 Triumph)
H. B. Denley (8 Morgan)
H. Poole (6 A.J.S. sc.)
H. O. Heith (2½ A.J.S.)
F. W. Gies (6 A.J.S.)
R. Baker (4 Triumph)
H. Jones (3½ Sunbeam)
W. N. Tetley (3½ Sunbeam)
E. Arch (8 New Imperial sc.)
J. E. Greenwood (8 Sunbeam)
T. Stevens (4 James sc.)
H. R. Fowler (5-6 James sc.)
L. Clark (5-6 James sc.)
H. Boynton (5-6 James)
K. E. Hay (5 Hazlewood)
H. Edwards (4 Sunbeam)
E. Kibble (4 Triumph)
L. Baker (4½ B.S.A. sc.)
S. T. Hill (5-6 James sc.)
O. Oerton (4½ Ariel sc.)
L. Newey (4½ Ariel sc.)
W. E. Emery (3½ Rudge Multi)
E. W. Cholderoff (4 A.J.S.)
S. Pettit (5-6 James sc.)
H. P. Cutler (4 Norton sc.)
R. H. Nicholls (4½ B.S.A. sc.)
F. T. Watson (4 Norton sc.)
A. P. A. Rose (8 Royal Ruby sc.)
V. G. Webb (2½ Douglas)
H. D. Meade (2½ N.U.T.)
H. A. Pattman (4 Norton sc.)
R. W. Vaughan (5-6 James sc.)
F. E. Mucklow (4½ James sc.)
T. Pollock (5-6 James sc.)
H. I. Stretton-Ward (4 Triumph)

Price of Petrol.

The Petroleum Times says there is very little prospect of the price of petrol coming down to pre-war level.

THE MOTOR CYCLE SUMMER NUMBER JUNE 19th,

Will contain many SPECIAL ARTICLES of interest to all motor cyclists, including

HERE TO GO FOR THE SUMMER TOUR

Written by motor cyclists familiar with the districts they describe.

A REVIEW OF DESIGN IN 1919.

THE FAMILY SIDECAR.

The most popular vehicle on the road, and why.

THE YOUTHFUL MOTOR CYCLIST.

Why the motor cycle appeals to the young man.

NO AGE LIMIT.

The motor cycle as a suitable mount for the man of mature years.

The usual popular features of "The Motor Cycle" will be retained.

British Crude Oil.

It is difficult to estimate the true value of the reports concerning the oil boring undertaken by Lord Cowdray at Chesterfield.

Second A.C.U. Committee Meeting in the Provinces.

The directors of Douglas Motors, Ltd., and the Bristol M.C.C. are making arrangements to entertain the A.C.U. Committee when they visit Bristol for the second meeting of the 1919-20 session to be held in the provinces. The meeting will be held at the Grand Hotel, Bristol, on the 20th June, and a number of bedrooms have been reserved for members of the committee. Those members of the committee wishing to reserve a room should communicate with the manager.

For the morning of the 21st, Douglas Motors, Ltd., have invited the committee to view their works, and will provide sidecars to convey the visitors from the hotel. The directors have also invited the committee to take lunch with them that day, and afterwards propose to convey their guests to either Weston-super-Mare or Cheddar Gorge, where an event is being organised by the Bristol M.C.C.

Police and Lighting Regulations.

Exeter police are particularly busy regarding the motor light regulation. The regulation prohibits a car carrying lighted head lamps, the glass of which exceeds 5in. in diameter. A London chauffeur was summoned for an infringement of the regulation, and his solicitor rightly pleaded that the regulation was difficult to understand. A light up to five inches diameter need not be obscured, but if it exceeds that diameter the whole must be darkened. Few people, said the solicitor, knew this, and defendant pleaded ignorance of the regulation. The summons was dismissed on defendant paying the costs.

R.A.C. Annual General Meeting.

This meeting was held at the Club House, Pall Mall, on the 29th May, the chairman, the Hon. Sir Arthur Stanley, G.B.E., C.B., presiding.

Reviewing the work of the Club during the war, the Chairman stated that there had been a large increase in the membership, and that the Club was in a sound financial position in spite of the difficulties caused by the war. In the first days of the war the Club offered honorary membership to all overseas officers: knowing that it was difficult for an officer from overseas to find accommodation in London, that he would be practically stranded, and probably know nobody, the Club felt that he was a man to whom of all others it should be the first to offer hospitality. 14,000 overseas officers had availed themselves of this privilege, and the committee had had gratifying testimony to the value and appreciation set upon the privilege of honorary membership. That hospitality would continue until all such officers had returned to their homes.

The R.A.C. War Service Department was instituted in order to help the Government at a difficult period. The total mileage accomplished by these voluntary drivers, as far as an estimate could be formed, was over 37,000,000.

Mr. A. F. Bird, M.P., expressed the appreciation and thanks of the Colonial Office for the splendid hospitality extended to overseas officers.

An experimental model 8 h.p. Sunbeam fitted with spring frame. This machine is undergoing strenuous tests at the present time.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Herford Street, Coventry, and must be accompanied by the writer's name and address.

EASY STARTING.

Sir,—As an A.J.S. rider, I was much interested in "K.O.S.B.'s" letter in *The Motor Cycle* of May 15th. My machine is a 1914 2½ h.p. model, and I have never had the slightest trouble in starting. During the war the machine was idle at one period for over twelve months, and on taking it out it started at the first kick. This was with pre-war spirit, a little of which I had on hand. Again, however, the machine was "laid up," but this time for quite two years, and on trying the engine it started and ran perfectly at the third kick; the spirit used being War Grade 1. Such a performance may seem questionable, but I can absolutely guarantee the truth of my statement. AJ 2394.

South Shields.

Sir,—Several of your contributors have been complaining recently in your columns of difficulty in starting.

I was troubled with this very much until recently with a Morgan Runabout, and then I cured it in the following manner.

I now carry a small piece of muslin about two inches square, and when I flood the carburettor (Binks) I hold the rag underneath the float chamber, and let it absorb the overflow. Then, pushing the petrol-soaked piece of cloth into the air intake, one pull up of the starting handle invariably starts the engine. Then remove the rag.

Hoping this may be of some use to some of your readers, Dungannon. R.A.F. (Pilot).

THE CAPACITY OF TWO-STROKES.

Sir,—Would it not be far more accurate, and also more advantageous to the two-stroke, if the period that the ports are open is excluded from the stroke for the purpose of calculating its capacity? For instance, my Allon has a bore and stroke of 70 x 76 mm. = 292 c.c. Suppose that the ports are open for 6 mm. of the stroke, and calculate the capacity 70 x 70 mm. = 269 c.c. Also put down the nominal horse power from this.

My reasons for suggesting this are: (1.) That this really measures the quantity of mixture that the cylinder can take. (2.) That consequently the power can be more correctly assumed from this.

I should like to know of any objections to this by readers. Ilfracombe. R.E.C.

COURTESY ON THE ROAD.

Sir,—As some of your correspondents have pointed out, many present day motorists lack the *esprit de corps* to help motorists who are delayed by breakdown on the road. For instance, on May 10th, whilst travelling from Bradford to Bolton Abbey I spent an hour in assisting an unlucky rider. But, on the way back, my friend on a Harley-Davidson and sidecar ran into a flood on the road, and we could not do anything, and six miles from home. The Morgan I rode had sooted plugs, and no good spare plugs.

Out of well over one hundred motorists who passed not one stopped to ask if he could assist; and yet the aid of two plugs, which I would have paid anything for, would have got us out of the difficulty. Without them my own machine would hardly move.

Finally, we partially cleaned two plugs, and the Morgan was compelled to pull the Harley-Davidson and sidecar and three people six miles up steep gradients of between 1 in 10 to 1 in 5 up to Heaton. (Anyone who knows this district will realise what this means.) It did it with three stops, and all credit to the makers of the Morgan, but it has done a lot of damage as it is a 1914 machine.

A little "do as you would be done by" would have saved us all this trouble and expense.

I hope you will excuse this from a great admirer of your paper, to whom Thursday is the day of the week.

Bradford.

AH 1707.

ONE-LEGGED RIDERS.

Sir,—I regret to find that your correspondent "Gammy Leg" should have cause to complain at the manner in which manufacturers have treated his application for a machine suitable for a rider with only a right leg.

I have also lost my left leg, but have had no difficulty in finding a suitable machine. The machines I am riding, and will always ride, are the 2½ h.p. and the 4 h.p. Douglas.

This make is most comfortable and free from vibration, and I find it the most suitable machine. I am sure it would suit your correspondent, as the machine can be controlled without the use of the left leg.

I would also say that the Douglas is suitable to the man who has lost his right leg, and if he would take advantage of my experience, which I have previously recorded in these pages, he would have nothing but a Douglas. I have previously suffered considerably in using other engines that were not so vibrationless. E. G. FERY.

THE ARBUTHNOT TROPHY.

Sir,—I note with interest your statement that the rules and regulations for the Arbuthnot trophy event will be announced shortly. The point to which I wish to draw attention is the fact that "the start and finish will be at Plymouth." Though it does not necessarily follow that the whole event will be concentrated round that area, I submit it would be much more convenient for this event to be held in the Midlands, and more or less equidistant, and more get-at-able from all Naval depots and bases, such as Portsmouth, Chatham, Harwich, Rosyth, and even North of that. Probably it is too late now to alter any arrangements already made, but as the majority of the ships in home waters are not at Plymouth it consequently means at least two days more leave being asked for than if it had been held in the Midlands, and may prevent quite a number of would-be competitors from entering. It is not just a question of asking for leave and getting it even these days.

H.M.S. *Commonwealth*. CEDRIC NAYLOR, Lt. R.N.

[The rules and regulations of the Arbuthnot Trophy trial are given elsewhere in this issue.—Ed.]

EMPLOYMENT FOR DESPATCH RIDERS.

Sir,—We have noticed the letter from "L.A.C." in your issue of the 29th ult., and are writing so that he and any other despatch riders who may be in the same boat may take their opportunity.

As our name indicates, this company has been formed by ex-D.R.'s, and our aim is to employ as many ex-D.R.'s as possible.

We have not, unfortunately, been able to get into full swing as yet, and cannot offer employment to more than one or two at the moment, though later we shall hope to do more.

In the meantime we shall be glad to hear from any ex-D.R.'s who may be wanting employment. They should state their qualifications and also their army service, as, in the event of there being more applicants than we can employ, this will be taken into consideration.

THE D.R. ENGINEERING CO., LTD.
R. S. MANSFIELD, Director.

SALES OF ARMY MOTOR CYCLES IN THE PROVINCES.

Sir,—In a recent issue of your journal I was glad to see the article in connection with sales of Army motor cycles in the provinces. It is absolutely unfair to prospective buyers in other large towns to be denied this privilege, and especially men who have done their "bit," on the saddle. I feel sure your many readers outside London would be grateful to *The Motor Cycle* if a change of place for these sales is brought about. J. A. PARTINGTON.

PRICES OF MOTOR CYCLES.

Sir,—In your issue of May 22nd, "Satisfied" is certainly "one of the lucky boys!" My experience during the past few months has been the reverse. I have advertised and answered advertisements, but "na-poo." I am in want of a good combination, not less than 4 h.p. with suitable touring gears, and would have paid a good price, but nothing worth the money asked has crossed my path. Next season perhaps those who have paid such high prices for 1914 and older machines will be glad to sell at half the price they paid this year. Meanwhile, I think I shall not do better than wait until a good reliable single or twin combination is offered at a reasonable price. At the same time I am confident *The Motor Cycle* will be "dead nuts" on any shady deals that are exposed any time.

DISAPPOINTED.

SPARE PARTS.

Sir,—I have read your Correspondence columns with great interest, lately on the subject of obtaining spares, etc.

I was very badly placed through a mechanic fitting, or misfitting, an X-L-All pan-seat on my motor cycle with two springs of different tensions, resulting in smashing up the underwork. I was about to proceed on a tour, and tried every garage in my county, asking it to procure one for me. The great majority told me that they would order, but it would be weeks or even months perhaps before I got delivery.

I thereupon wrote X-L-All Ltd. explaining how I was placed, and they sent me the required part per return complete to the merest detail, and from a very vague description from me. I had not had any previous dealings with this excellent firm, although I have used their saddles for a considerable period, and I may say that they cannot be beaten for use and comfort when riding, especially on very long runs.

I may add that I did not send cash with order either.

In my opinion if the motoring public were to combine together and only patronise firms such as the above, leaving out of the running the firms who do not even reply to one's order, a change would result.

Westbury.

COMFORT SEEKER.

Sir,—I should like to present the other side of the spare part argument. I have a 1913 A.J.S., which required new valve guides. Although out of stock of these old parts the firm in question got them specially cast and machined in a little over a week, and at a reasonable charge. I am not even a shareholder.

MANCHESTER.

GOVERNMENT MOTOR CYCLES FOR EX-OFFICERS.

Sir,—With reference to the enormous numbers of motor cycles which are obsolete or must be sold, as they will not be required, would it not be a good opportunity for the Government to recognise the services of officers, who have been wounded or invalidated out of the Army, by allowing them the option of purchasing a motor cycle for their actual own use at a nominal sum?

A kindly act such as this would be greatly appreciated by numbers of officers who offered their services to their country, and would make them feel that they have not been overlooked in the disposal of the surplus stock.

It should, of course, be a *sine qua non* that, an officer being allowed to purchase a machine at a nominal cost, it should be for his own use only, and that he should not be allowed to part with the said machine without the consent of the War Office having first been obtained.

In hundreds of cases an arrangement of this kind would be an immense boon to officers who could not afford to purchase motor cycles in the open market, and it would provide them with a form of recreation which they could not obtain, except in rare cases, were they obliged to purchase machines through the ordinary business channels.

A concession such as this on the part of the War Office would be highly appreciated, and would be a further opportunity for it to recognise the services of young officers.

C. FITZGERALD A. BIRD.

GRADIENT WANTED.

Sir,—I would like to know the gradient of a hill in North Wales, which is situated about four miles from Mold and runs off the main road between Mold and Ruthin. The hill in question is on a byroad from Llanferres to Maes Hafn, and, I believe, has been used as a test hill by some of the Liverpool clubs.

H. MIDDLETON JONES.

Heswall.

FOUR-STROKE V. TWO-STROKE.

Sir,—As regards lightweights, I think the four-stroke type beats the two-stroke type every time. Let us compare the advantages and disadvantages of both types.

	Four-stroke.	Two-stroke.
Maximum speed ...	45-50 m.p.h.	35-40 m.p.h.
Reliability	Reliable.	Reliable.
Fuel consumption...	100-120 m.p.g.	80-110 m.p.g.
Oil consumption ...	Good.	Bad.
Simplicity	Not very simple.	Very simple.
Carbon deposit	Decarbonise once every 2,000 miles.	Decarbonise every 600 miles.
Starting	Easy to start.	Easy to start.
Overheating	Does not overheat easily.	Overheats very easily.
Hill-climbing	Good.	Very good.

Also, the average two-stroke's consumption of plugs is absolutely abnormal. If you drive over 25 m.p.h. for any length of time the average two-stroke machine will show distinct symptoms of "tiredness," whereas I have driven a 2½ h.p. J.A.P.-engined lightweight for nine miles at an average of 31 m.p.h. without showing any signs of overheating.

As far as I can see, the only advantages the two-stroke has are: (1) Simplicity; (2) good hill-climbing; and (3) cheapness. As regards cheapness, I think the average man would pay an extra £5 for a four-stroke.

R.N.

This narrow, rutty, and stony by-lane, with a gradient of 1 in 6 or so, is a sample of the "going" selected by trials committees in their endeavour to eliminate a number of riders. The modern machine, however, is seldom balked by gradients alone, but loose stones or mud on hills of 1 in 3 or less certainly do call for good driving.

A LIGHTWEIGHT T.T.

Sir,—We are pleased to see that you are taking up the question of a lightweight T.T., and notice you suggest a c.c. of 200 to 225. In our opinion it would be advisable to increase this to 275 c.c., as our experience proves that engines of very small capacity, after running a year or two, fall off in power to such an extent that the average owner becomes disgusted with it, for he does not properly understand that it is due to wear, and can be put in order by a little expert attention.

In addition, we would like to see some means taken, particularly with the two-stroke, to safeguard excessive petrol consumption, for, as you are no doubt aware, extraordinary power can be obtained from the two-stroke, but the petrol consumption is generally heavy, and would be entirely misleading to the public if some means were not taken to check this.

VELOCE, LTD.,

J. GOODMAN, Managing Director.

[We commend these suggestions to the notice of the Antio Cycle Union.—Ed.]

INFORMATION WANTED.

Sir,—Within the next few weeks I shall proceed to Basra on business, and desire to take with me my motor cycle, a 1914 Triumph (an old and trusted friend) fitted with Sturmey-Archer three speed hub. Would any of your readers, ex-D.R.'s in Mesopotamia, be good enough to give me the following information either direct or through your correspondence pages (in which latter case the information would, no doubt, be of general interest). (1.) Does the dust and sand in any way injuriously affect the engine, gear, or wheel bearings, and should any special precautions (such as fitting gauzes in the induction pipe) be taken? (2.) How does the summer heat affect the tyres? (3.) Are there any roads in the Basra-Bagdad district fit for riding on? (4.) Generally, whether it is desirable to take a motor cycle to such a climate and, if so, should any special steps be taken in order to keep it in good order and prevent undue deterioration?

R. A. GUTHRIE.

MOTOR CYCLES FOR THE DISABLED.

Sir,—After reading in *The Motor Cycle* "Motor Cycles for Disabled Men," I thought my own case might interest some of your readers. I was wounded rather severely in the left arm; but, strangely, the arm has grown quite strong, and has left the hand partly paralysed, so that it is impossible for me to get a grip. Under these circumstances it seemed as if I should have to give up motoring, but I "chanced my arm" with an Ivy two-stroke with fixed ignition and gear. I had to change the decompressor lever to the right handle-bar, and, to prevent my right hand slipping off the handle, I made a stiff leather gauntlet lined with camel fleece and fitted with a wind cuff. The elastic in the cuff of the gauntlet gripped my left wrist and held my hand in position. Thus, I was enabled to steer quite easily and comfortably with the damaged arm, and, when necessary, it was quite safe to take my right hand from the handle-bar for any purpose. Since my first experiment was successful I have grown bolder, and now ride a new model New Imperial with kick-starter, two-speed, and clutch. I converted the hand-controlled clutch into foot-controlled, and placed the lever on the right foot-board. Then I changed over the exhaust valve lifter to the right, and now all controls are operated by the right hand. With the aid of my priceless leather cone I can ride as easily and safely as if I had the full use of both hands.

In a few weeks I shall require some practical advice, as I have on order a new A.B.C., and that will have to undergo the same treatment as regards alterations to clutch and exhaust valve lifter, unless, of course, this catches Mr. Bradshaw's eye, and he can make the necessary alterations for me before I take delivery.

ONE PIP—YORKSHIRE.

Sir,—I noticed a letter in your issue of the 3rd inst. with reference to motor cycling with one leg. I regret not having been able to give my views earlier, but think my experience might be of use to many riders with one leg. Personally, I have lost my left leg above the knee (middle third). I had a $2\frac{3}{4}$ h.p. A.J.S. at the time, and rode it several times after having my leg off, but before I had much confidence, and decided it was too heavy and high. I then obtained a $2\frac{3}{4}$ h.p. James two-stroke with 24in. wheels, on which I covered thousands of miles, and climbed many long and steep hills, including Red Bank, near Grasmere.

I think for anyone starting to motor cycle with one leg it would be very inadvisable to try and ride solo a heavy machine such as the ones mentioned by your correspondent, who may possibly be very long in the leg, abnormally strong, or only have his leg off below the knee.

Another point I would mention is that with certain machines and types of handle-bars the latter are apt to catch the wooden leg when turning to the side of the wooden leg, and consequently throw one off.

With regard to the side for the brake, this is not very important, as it can easily be changed over. I have not had Bowden handle-bar controls fitted to rear brake, and do not personally consider it necessary.

The Baby Triumph, Enfield two-stroke, and Clyno two-stroke are all suitable machines, also the $2\frac{3}{4}$ h.p. Douglas. I never had any difficulty in starting by paddling off, provided I put a rag in the air inlet in cold weather and cleaned the dirt out of the carburetter occasionally.

Hulme.

N.O.O.E.

A.C.U. SIX DAYS TRIAL.

Sir,—I take the liberty of making the following suggestions for consideration by the A.C.U. Competitions Committee when the rules and regulations for the Six Days Trial are being compiled.

(1.) That two trials be held—(a) one for solo machines and (b) one for sidecar and passenger machines.

(2.) That all machines be ridden by amateurs.

(3.) That a reasonable allowance of petrol be made for each day's journey. The petrol to be obtained at certain points only, and the tanks sealed. Any machine failing to complete the journey on the allotted amount to fall out of the competition.

(4.) That, if it could be arranged, tyre trouble should not disqualify, provided in other respects the machine performed satisfactorily.

(5.) That a system of marking be adopted which should take into consideration the total weight of the cycle or outfit, plus passenger or passengers.

(6.) That cleanliness be given a prominent position as regards marks.

(7.) That a minimum low gear ratio be established.

Suggestions 1 and 2 would prevent the trial from becoming too unwieldy as regards numbers.

In addition, No. 2 would show the performance of machines in the hands of the ordinary riding public.

If desirable, a trade trial could also be held.

As regards No. 3, it could be arranged that a distance of 100 miles had to be traversed before additional petrol could be obtained. This would enforce the fitting of tanks of a sensible size.

It is obviously unfair that a machine should be penalised merely because a nail is picked up on the road. This is a case of luck, not mechanical weakness. Hence No. 4.

No. 5 protects the standard touring outfit. The same applies to No. 6.

No. 7 prevents a machine with freak gears from scoring over the machine fitted with the ordinary type gear box.

C. J. LEATHERBARROW.

MAPS FOR MOTOR CYCLISTS

"THE MOTOR CYCLE" ROAD MAPS.	Price.	Post free.
1. England & Wales. 2. Scotland. 3. London, (Showing roads into and out of London and avoiding London.) Set of three, complete in case	4/6	4/10
"The Autocar" Map of England and Wales. Dissected and folded in neat case cloth	12/6	13/-
Also on rollers (a good wall map)	12/6	13/-
"The Autocar" Map of Scotland		
"The Autocar" Map of Ireland.		
Same styles and prices as above.		
"The Autocar" Sectional Map of England and Wales, Consisting of 24 loose sections on strong card, in stout waterproof envelope .. (complete)	5/-	5/6
In leather case, transparent front	15/-	15/6
"The Autocar" Half Inch Map of England and Wales. In 37 sections. Each section	3/-	3/2
"The Autocar" Map of South Eastern England.		
In stout waterproof envelope	3/6	3/10
In leather case, transparent front	15/-	15/6

Obtainable by post (remittance with order) from
ILIFFE & SONS Ltd., 20, Tudor Street, London, E.C.4.
or of leading Booksellers and Railway Bookstalls.

A SIMPLE TAIL LAMP.

A TAIL lamp of simple design has lately been placed on the market by James Grose, Ltd., Old Jewry, London, E.C.2. The little lamp is symmetrical in appearance, and quite well finished. It is lit by applying the flame of a match to a couple of holes underneath the burner, so that the front need not be opened.

A tail lamp of a clean design.

SADDLE COMFORT.

ALTHOUGH quite a number of motor cyclists use back rests on their saddles, probably more would use them if arranged so that they could be

A "swing down" back rest of American design.

swung down conveniently for mounting. Such a back rest has recently been introduced by an American firm, and, as will be seen from the accompanying illustration, is quite simple in principle.

A NEAT PETROL FILTER.

MOTOR cyclists who have suffered from water and other impurities in war petrol will be interested in the simple little filter which is to be marketed by Messrs. Rotherham and Sons, Ltd., of Spon Street, Coventry. The body is a simple bronze casting, having an inlet orifice on one side and an outlet directly

A petrol filter which may be fitted to the majority of existing machines.

opposite. The filter gauze is attached to a short length of tube, which is held in position by a peg and is bevelled off from top to bottom so as to expose the largest possible gauze surface to the flow of petrol. A sump is formed in the body casting, directly below the gauze, and "sludge" may be drained from this either by a tap or plug. The gauze and its tubular mounting are held in position by a screw-on cap, and the complete filter is very small and neat.

THE LICOPHOTE INSPECTION LAMP.

ONE of the handiest and most ingenious inspection lamps we have yet had the pleasure of seeing is known as the "Licophote," sold by the Engineering Accessories Company, 2, Army and Navy Mansions, 115, Victoria Street, Westminster, London, S.W.1.

It consists of a small pocket flash lamp battery of good quality in a khaki twill case, held by a simple wire frame. On the top is a small box, at one end of which is a spare bulb in contact with the terminals of the battery and covered with a red celluloid disc. At the other end is a detachable plug, with an ample length of flexible wire leading to the inspection lamp, and also a switch for switching on the rear light.

In the twill case there is a pocket for a spare red disc. The battery frame is provided with a projection so that the battery can be hung inside the pocket or on the motor cyclist's belt. In this position the inspection lamp may be conveniently used, and in the event of there being necessity to do any serious work at night the inspection lamp is dropped down the sleeve and held by means of a wire clip, which can be slid up or down the flex so as to adjust the length of wire to suit the size of sleeve. In this position the lamp is securely held on the sleeve and shines on the work while the adjustment is made, leaving both hands free.

The spare-bulb holder can be removed and the bulb detached by pressing the two springs which hold the red disc in place. The red disc comes away and the bulb may be lifted from the clip which holds it.

The idea is that, in the event of a motor cyclist being suddenly overtaken by darkness, with both lamps out of order, he can hold the inspection lamp in his hand and use it as a head light, hook the battery on to his pocket, and shine the red light to the rear, thus covering two or three miles still conforming to the law.

The whole device is beautifully made and well finished, and should undoubtedly appeal to motor cyclists, especially those who are entering for the London-Edinburgh run. The inspection lamp may be switched on or off by twisting the metal part of the bulb holder.

TRIPLEX GLASS GOGGLES.

Triplex safety glass goggles returned from France by an officer who reports that he fell from a great height, but his eyes were not hurt owing to the fact that he was wearing Triplex unsplinterable goggles.

AN IMPROVED COMPRESSION TAP.

AN effort to improve upon the existing form of compression tap has been made by Capt. Lubbock, of the Sittie Valve and Engineering Co., 60, Chancery Lane, London, W.C.2.

In the left-hand drawing, Capt. Lubbock has attempted to show the source of leakage in the existing form of compression tap. From the drawing of his improved device, it will be seen that the

The usual type of compression tap, showing where leakage frequently takes place, and a needle type designed by Capt. Lubbock.

tap is of the needle valve variety, and screws down on to a ground tapered seating, while there is a lever for locking the stem, so that leakage is impossible. The lid covering the cup has a series of holes drilled in it, through which petrol may be injected, and its centre serves as a bearing for the valve stem.

The Licophote inspection lamp.

Liverpool.

Sheffield and Hallamshire M.C.C.

The trial for the Dickenson and Darwen cup, held at the end of last month, will probably result in a tie between F. Dover (4 h.p. Douglas sc.) and H. Reynolds (4½ h.p. B.S.A. sc.).

Redditch and District M.C.C.

The results of the speed-judging competition are as follows: 1. W. Hillman (4¼ B.S.A. sc.), no error; 2. H. Herbert (4¼ B.S.A. sc.), 13s. fast; 3. R. Nicholls, jun. (4¼ B.S.A. sc.), 25s. slow.

N.M.C.F.U. (Wolverhampton).

The reorganised Wolverhampton branch of the N.M.C.F.U. promises to be a success, and the recent opening run to Wellington was well attended. Several members attempted to climb the Wrekin, and the riders of a 3½ h.p. Sunbeam, 7-9 h.p. Indian, and 3½ h.p. James succeeded. Mr. George Stevens (6 h.p. A.J.S.) made a sensational climb.

Western M.C.C. (Glasgow).

The opening run of the club took place under ideal weather conditions on May 25th, the destination being Rowardennan, Loch Lomond. Upwards of thirty partook of an excellent lunch provided at the hotel there, and an enjoyable hour was spent in enjoyment of the sunshine and beautiful surroundings. The hon. secretary is Mr. J. Robinson, 250, Great Western Road, Glasgow.

Blaenavon M.C.C.

Great interest was shown in the recent hill-climb on the hill between Govilon and Blaenavon which includes the noted Fiddler's Elbow. This was the first competition held by this newly formed club and proved a great success, the climb being witnessed by about 500 spectators. The results were as follows:

LIGHTWEIGHTS (up to 3 h.p.).—E. Howells (2¾ Calthorpe-Jap).
SOLO CLASS (3½ to 4¼ h.p.).—A. Williams (4¼ B.S.A.).
SIDECARS (3½ to 4¼ h.p.).—D. Williams (4¼ James).
SIDECARS (6 h.p. and over).—H. Howells (6 Enfield).

Worcester and District M.C.C.

A meeting was held at the Grandstand Hotel, Worcester, on Friday last, when it was unanimously decided to form the above club. There was a good attendance, and about twenty members were enrolled. It was resolved to hold a general meeting later on to elect officials, etc. The opening run was arranged for Sunday, June 15th, to Stratford-on-Avon, starting from the Grandstand Hotel at 2.30 p.m. prompt. All intending members and friends are especially asked to communicate with C. E. Tysoe, 38, Droitwich Road, Worcester (temp. hon. sec.).

Future Events.

June 6.—Essex Motor Club. Midnight Ride to Yarmouth.

JUNE 6.—M.C.C. LONDON-EDINBURGH RUN.

JUNE 7.—Blaenavon M.C.C. Run to Llangorse Lake.

JULY 16.—ESSEX MOTOR CLUB. SPEED TRIALS AT SOUTHEND.

JULY 16.—BIRMINGHAM M.C.C. MIDLAND CUP TRIAL.

JULY 16.—MIDDLESBROUGH AND DISTRICT M.C.C. 200 MILES RELIABILITY TRIAL FOR GJERS AND NEW HUDSON CUPS.

AUG. 16.—S.E. COUNTIES INTER-TEAM TRIAL.

SEPT. 5.—M.C.C. TEAM TRIAL FOR "THE MOTOR CYCLE" CUP.

SEPT. 15-20.—A.C.U. SIX DAYS RELIABILITY TRIALS.

Birmingham M.C.C.

The Birmingham M.C.C. social run (vice-captain's day) was to Warwick via Kenilworth. The vice-captain, Mr. T. Silver, to give further interest to the run, organised boat races on the river at Warwick, for which twenty-four entries were received.

Rochester, Chatham and District M.C.

The run for the 8th inst. is to Herne Bay, and on Whit-Monday to Battle. On the 29th inst. there will be an inter-club meet with the Streatham and District M.C.C. and Woolwich, Plumstead, and District M.C.C., in order to go over the course for the intended team trial for the Matchless cup. The Rochester club has arranged to enter a team of six, and those wishing to compete should send their names to the hon. sec., Mr. S. White, 3, South Avenue, Rochester.

An Open Scottish Hill-climb.

To be held under the open competition rules of the Scottish Auto Cycle Union, the Western M.C.C., Glasgow, is organising an open hill-climb on the 14th inst., in which there will be five classes. These classes are as follows: (1.) Motor cycles under 350 c.c. (2.) Motor cycles over 350 c.c. and under 600 c.c. (3.) Motor cycles exceeding 600 c.c. (4.) Sidecars under 600 c.c. (5.) Sidecars exceeding 600 c.c. A prize will be awarded to the winner in each class on the following

formula, $\frac{\text{weight}}{\text{capacity} \times \text{time}}$, provided six

entries are received for each class. The trials hon. secretary is Mr. E. Napier White, Sunnybank, Campsie Road, Hillpark, Glasgow.

Edinburgh and District M.C.

The first open one-day trial of the Edinburgh and District M.C., held at the end of last month included a course of 170 miles. There was a large entry, but only thirteen competitors qualified for awards. These were:

Fred J. Hutchison (8 Matchless sc.)
 D. Balloch (6 Enfield sc.)
 G. Crinton (4¼ B.S.A.)
 A. J. C. Lindsay (6 A.J.S. sc.)
 W. H. S. Miller (3½ P. and M.)
 W. H. Anderson (4 Triumph)
 J. R. Alexander (8 Enfield sc.)
 R. S. Macrae (7 Harley-Davidson sc.)
 C. B. Burney (3½ Blackburne)
 A. L. Downie (2¾ A.J.S.)
 N. W. Downie (2¾ A.J.S.)
 D. Bell (6 A.J.S. sc.)
 D. S. Alexander (8 Enfield sc.)
 T. A. McCreadie (8 Sunbeam)

The club has decided to hold several very interesting trials in the near future, and the first of these will probably be on the 14th inst. Details of this trial can be obtained from Mr. J. W. Anderson, 6, Castle Terrace, Edinburgh.

Essex M.C.

It has unfortunately been found necessary to postpone the Southend speed trials, which were provisionally fixed for the 25th inst., and, subject to the approval of the Corporation of Southend-on-Sea, they will be held on July 16th, on the Western Esplanade, Westcliff-on-Sea.

Entry forms, etc., will be posted at the end of the present week to those who have applied for them. Full particulars may be obtained upon application to the hon. organising secretary, Mr. Harold Fuller, 51, Pulteney Road, South Woodford, Essex, E.18.

Glasgow M.C.C.

The results of the hill-climb on Rest and be Thankful are as follows:

CLASS 2, not exceeding 600 c.c. (formula).

1. W. Deans (3½ Ariel).
2. Capt. Walker (3½ Triumph).

Fastest time, Walker (3½ Triumph).

CLASS 3, exceeding 600 c.c. (formula).

1. D. Brash (7 Harley-Davidson).
2. A. Brash (7 Harley-Davidson).
3. D. S. Alexander (8 Enfield).

Fastest time, T. Brash (7 Harley-Davidson), formula.

CLASS 4, sidecars not exceeding 600 c.c.

1. W. Deans (3½ Ariel s.c.).
2. H. W. Ballardie (A.J.S. s.c.).
3. N. Fraser (Sunbeam s.c.).

CLASS 5, sidecars exceeding 600 c.c.

1. — Barclay (A.J.S. s.c.).
2. — Wright (5 Indian s.c.).
3. — Baddeley (A.J.S. s.c.).

Fastest time, A. Brash (7 Harley-Davidson).

Bristol M.C.C.

A special general meeting was held on Thursday, the 22nd ult., when there was a large attendance. Twenty-six new members were elected. Mr. J. King was elected vice-captain. The secretary reported that the entries for the Whitsuntide club trial are coming in splendidly; entries close to-day.

The speed trials (open) at Weston-super-Mare are fixed for Saturday, the 21st inst.

Coventry and Warwickshire M.C.

The winner of the Manville Trophy, for the second time in succession, is S. Crawley (4 Triumph sc.), whose error in time at the secret check, which had to be used to decide the winner, was eleven seconds.

The special prizes were awarded:

CLASS I. (Solo).—G. L. White (4 Triumph).

CLASS II. (Sidecar).—A. R. Grindlay (8 Harley-Davidson s.c.).

CLASS III. (Cars).—S. Wright (10 Humber).

It has been decided to hold a trial on the first or second Saturday in July in order to test the brakes and clutches of the machines and the skill of the drivers. The trial will be held on a circular course, not exceeding ten miles

in circumference, and will embrace several stiff hills, of which, both on the upward and downward journeys, there will be stopping and starting tests on each round.

In all probability the team which will be selected to represent the Coventry and Warwickshire Club in the M.C.C. team trials, to be held in September, will be picked as the result of this trial.

Exeter M.C. and Junior Car Club.

Exeter Motor Cycling Club has been revived and there is every prospect of a successful season. The name of the club has been altered to the Exeter Motor Cycling and Junior Car Club, this being with a view to bring into membership owners of light cars. At the opening run on the 24th ult., there was a good attendance.

Oldham and District M.C.

Practically ninety-eight per cent. of the competitors in the Oldham and District M.C. trial made a non-stop run. The ideal conditions were responsible for this, as the course would have been a difficult one had the weather been wet. The majority of the competitors were ahead of time at the secret check. The following are the results: T. Leach (4 Bradbury), loss of eight marks; F. Wilson (4 Triumph sc.), loss of eleven marks; H. Holt (6 Bradbury sc.), loss of twelve marks.

FAST AND SLOW HILL-CLIMB.

Northampton Club holds Interesting Event on Doddington Hill.

OVER a hundred spectators witnessed the Northamptonshire M.C.C. hill-climb last Thursday, when standard touring machines were made to climb Doddington Hill at their highest and lowest speeds on top gear.

The hill was 550 yards long with a gradient of 1 in 6, and each competitor had to make a standing start, returning to the bottom of the hill after his fast ascent and then making a second top gear climb in the "slow" test, the difference between the two times deciding the results.

It was originally intended to divide the entries into three classes, but finally only the heavyweight and 500 c.c. solo classes were adopted, as the sidecar class arranged did not attract sufficient entries to make a competition, but J. J. B. Croall (7 Harley-Davidson sc.) made an exhibition climb, covering the distance in exactly 30 secs.

The greatest speed on the hill was attained by G. M. Sharpe on a 3½ Norton, but his time, owing to a bad start, was 32½ secs. The various competitors' times are given:

HEAVYWEIGHT CLASS.

	Fast Climb.	Slow Climb.
	s.	m. s.
H. J. Bagsley, senr. (6 Rex)	30	.. 1 56
J. Bagsley, junr. (6 Rex)	33½	.. 1 51

500 C.C. CLASS.

J. B. Sneath (3½ Sunbeam)	37	.. 1 52
F. Grose (3½ Indian)	40½	.. 1 30
J. Paradise (3½ Norton)	31½	.. 1 45½
F. Jones (3½ Triumph)	36½	.. 2 0
M. Sharpe (3½ Norton)	32½	.. Failed.
R. Douglas (3½ Triumph)	41½	.. 1 48
J. Lucas (3½ Triumph)	50	.. Failed.
B. Dawson [ss. allow'ce] (2½ Douglas) ..	49½	.. "
J. Brown [ros. allow'ce] (2½ Campion) ..	63½	.. "

H. J. Bagsley, at the Northants M.C. hill-climb, winning the speed climb in the heavyweight class on a 6 h.p. Rex.

Finding a Winner by Efficiency Tests.

S. Birmingham Club holds Eighty Mile Trial with Stopping, Restarting, and Brake Test.

WITH the idea of eliminating the necessity of resorting to speed judging and secret checks as a means of finding winners of the Allday Cup and Joyce Shield, the S. Birmingham M.C.C. introduced tests for the competitors which had some bearing upon reliability and efficiency of their machines. A secret check was taken, however, in case of a tie. The features of the trial included a stopping and restarting test on Sunrising, a brake test on Edge, a surprise hill, and a water splash, and the exacting nature of the trial may be judged by the fact that only two competitors lost no marks.

Twenty-six entrants started, of which many were Allon two-strokes and Triumph solo and sidecars. The James, B.S.A., Norton, Clyno, A.J.S., Douglas, and Harley-Davidson were represented by one machine each.

Mr. E. Roberts, the organiser of the trial, evidently believes in the surprise element, and one must admit that a stop and restart on a hill are usually required when least expected. With this in mind, the spot selected for the stopping and restarting test was immediately round the S bend at a place where motor cyclists intent upon climbing the hill would be travelling fairly fast.

It was clear that few of the competitors properly understood what was demanded of them, and to this was due a large number of lightweight failures.

Such a test was comparatively easy for the larger powered machines, E. Boydell (6 A.J.S. sc.), H. Blumfield (6-7 Abingdon sc.), P. Cutler (4 Norton sc.), T. Stevens (4½ James sc.), H. J. Uzzels (4½ B.S.A. sc.), and T. Hufton (6 Clyno sc.), making the stop and restart in splendid style. S. Upton (7 Harley-Davidson) came round the bend too fast and, in pulling up inside the tapes, un-

Sidecars being timed away at Didsbury in the reliability trial held last Saturday by the Manchester Motor Club.

fortunately stopped his engine, and having to keep one foot on the brake to prevent the machine running backwards, could not restart the engine without assistance.

All the Triumphs, in the hands of A. W. Thrush, H. Walton, G. Dalby, — Hunting-ton, A. Gill, F. Stretton-Ward, and S. C. Lambert, did well, as did L. Newey on an Ariel sc.

From Sunrising the competitors were taken down Tysoe Hill, up Broom Hill, through Compton Wyniaties, and up Tysoe to Edge.

The brake test on Edge revealed that fully half the competitors had not read the rules thoroughly. 73½ yards were measured down the hill, which distance the competitors were required to cover in fifteen seconds (10 m.p.h.); at the end of this distance a marshal signalled for the competitors to stop, the distance allowed being three yards.

Very few succeeded in stopping in this distance, but it is probably true that all could have done so had they considered the matter properly.

Most of the competitors came down too fast, and did not apply the brake until they were actually on the first tape marking the three yards, with the result that they skidded a fair distance; the majority did not pull up under twenty to thirty feet outside the nine feet allowed. Upton (7 h.p. Harley-Davidson) proceeded for seventy or eighty feet with his rear wheel locked.

T. Stevens (James) stopped with his front wheel one foot over the line. G. Dalby (Triumph sc.) was one of the few to stop inside the tapes, while Newey (Ariel sc.) skidded right round inside the marks.

The test was very instructive, but also destructive to tyres.

After leaving Edge Hill the competitors had an easy run on main roads to Bearley Cross, after which place they had several miles of narrow lanes, with a surprise hill, unmarked on the route card, and a ford.

The results are as follow:

CLASS I.—MACHINES ABOVE 300 C.C.

1. L. Newey (3½ Ariel sidecar) No marks lost.
2. G. Dalby (4 Triumph)
3. T. Stevens (4½ James sidecar) ... Lost 2 marks.

CLASS II.—MACHINES UNDER 300 C.C.

1. B. Kershaw (2½ New Imperial) ... Lost 17 marks.
2. L. E. Clulee (2½ Allon) " 67 "
3. A. Elleman (2½ Allon) " 68 "

One of the competitors in the "potato race" event at the Hull Auto Cycle and Light Car Club gymkhana held last Saturday.

TWO NEW SCOOTERS OF THE PLATFORM TYPE.

Sir Henry Norman and Dr. A. M. Low's "Norlow" Described, and Particulars of a Privately-built Scooter.

constructed privately by Capt. Smith-Clarke, who is connected with one of the large Midland car firms.

The Norlow.

Sir Henry Norman and Dr. Low's machine is front wheel driven, and, although smaller and lighter than the American Auto-ped, it somewhat resembles it, in so far as well-guarded disc wheels and folding steering pillar are fitted.

The engine is a 60x60 mm. two-stroke, having an aluminium cylinder with a steel liner. The chain drive will be concealed, and adjustable through a 5in. diameter clutch. A main bearing 3in. long supports the crankshaft but at every other point ball bearings are used.

Petrol lubrication has been adopted as being the most simple, and a carburettor designed especially for the engine is fitted. For ignition the coil system has been adopted, dry batteries supplying the current for both ignition and lighting.

The main part of the engine unit is on one side of the front wheel, the main shaft passing through the centre of the hub, the flywheel being on the opposite side, and driving a countershaft on the fork side by a short chain, from the inner end of

which another chain transmits the power directly to the wheel.

An internal-expanding brake on the front wheel is operated by an upward movement of the steering pillar, and the compression release and throttle controls are by twist grips.

Leaf springs are fitted between the platform and the head, which, with the 2½in. tyres on 16in. wheels, should almost eliminate road shocks. The weight is said to be under 60 lb.

The Norlow will cost about £28, and will shortly be ready for the market, the commercial arrangements being in the hands of Major H. O. D. Segrave, 56, Conduit Street, W.1.

The Smith-Clarke Scooter.

The scooter designed by Capt. Smith-Clarke was made by him for use by his wife for shopping and general runabout purposes, and Mrs. Smith-Clarke informs us that, while the interest of the public is a little embarrassing, the machine has proved very useful.

We have tried this little machine and, while we think it would be improved by a spring fork and larger tyres, we were very favourably impressed by its running. So well distributed is the weight, that when one stands astride it and raises it by the handlebar, the wheels remain parallel with the ground. Capt. Smith-Clarke de-

monstrated that it was possible to ride for long distances without holding the steering bar.

We were particularly struck with the design and method of construction. The tubular portion is all triangulated, while the construction is such that "building" is reduced to mere assembling.

The framework consists of two steel plates, six tubes, with flattened and drilled ends, and a head and fork assembly with very few brazed joints. The engine fitted has a bore and stroke of 55 mm. and 60 mm. respectively, and has overhead valves. This is placed on one side of the frame, the "outside" flywheel and driving pulley being between the two main plates, with the direct-driven magneto on the opposite footboard. True, by driving the magneto at engine speed, an idle spark occurs in the top of the exhaust

A scooter designed and built by Capt. C. Smith-Clarke for use by his wife, who is now a scooter enthusiast.

stroke, but the higher speed of the magneto makes for easy starting.

Between the engine and the rear wheel there is a countershaft built up on an ordinary bicycle hub and carrying a V pulley, taking the drive from the engine by a small Whittle belt, and a small sprocket for the final drive.

The wheels are 20x1½in., the Auto-wheel size, and the machine weighs 55 lb.

AN AMERICAN T.T.

DENVER motor cyclists are making efforts to bring about a T.T. race in their district which, if it materialises, will be held on the Fourth of July. The course proposed is a triangular one, just outside the city limits, and eleven and a half miles long. Three sharp bends are included to test human as well as mechanical efficiency.

In stating their claims for the race to be held in their district, Denver motor cyclists mention that the Isle of Man T.T. course is upwards of eight miles. For the benefit of our American readers, we would point out that this course is 37½ miles in length, and is usually covered six times.

Dr. A. M. Low on the "Norlow," which he designed in conjunction with Sir Henry Norman.

SCOOTER enthusiasts are, at present, divided on the question of "to stand" or "not to stand," and the designs of the several little vehicles we have illustrated, and others which are in the experimental stage, are of two types—those fitted with seats, or saddles, and, therefore, to all intents and purposes miniature motor cycles, and those on which the accommodation is merely a platform.

Two additional machines of the latter type are illustrated, both of which are the designs of engineers, the Norlow being the result of experiments by Sir Henry Norman and Dr. A. M. Low, A.C.G.I., etc., and the other designed and

Broad side view of the Smith-Clarke scooter. Note the simple triangulated frame.

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

The Local Taxation Licence.

Q. Having sold my car (for which I took out a £4 4s. licence in January), and having bought a sidecar outfit, can I have the licence transferred?—MOTOR.

There is no need for you to take any further steps. The same local taxation licence will do (the greater including the lesser).

Erratic Running.

Q. I have an early 2½ h.p. Douglas, which is very erratic when working the throttle. When running at a slow speed and opening the throttle it does not increase speed for a time; then it suddenly races off at a terrible pace. Would you be good enough to tell me how to rectify this? Is the petrol level too high?—C.W.J.

The trouble seems to be probably due to a partial obstruction in the jet, which clears itself. As the machine is an old one, we should recommend you to overhaul it carefully; see that the valve tappets have the correct clearance, that the valves are in order, and that the springs are of the correct tension.

Timing.

Q. (1.) Are the inlet valve guides of the 1913 and 1914 2½ h.p. Douglas detachable? (2.) If so, how can I get mine out, as they seem to have become practically welded in? (3.) What is the correct valve timing for a 2½ h.p. Douglas?—B.G.B.

(1-2.) Up to the 1916 model Douglas, valve guides were not made detachable, therefore you cannot get them out. (3.) The valves should be timed as follows: The exhaust valve closes $\frac{1}{8}$ in. after the piston has completed the exhaust stroke. The inlet valve opens $\frac{1}{8}$ in. after the piston has begun the induction stroke. When one cylinder has been timed the other will follow suit. To time the engine, remove the cage and washers securing the timing wheel spindles. Slacken the nut securing the toothed wheel to which the valve cams are attached, and loosen the wheel by pulling it forward. The inside cam operates the exhaust valve. Bring the piston to the top of its stroke, move round the cam against the valve tappet, in the opposite direction to that in which the flywheel moves, until it has just ceased to bear against the tappet, then move the flywheel forward so that the piston descends $\frac{1}{8}$ in., and mesh the gears. The valves will then be found to be set accurately.

Pre-ignition.

Q. I have a 1915 2½ h.p. Douglas, and, after running a few miles, the engine stops on any long hill. The stop is preceded by a series of jerks, and changing into low gear does not remedy matters. I have cleaned the jet (a No. 24), and, so far as I know, the Amac carburetter is quite all right. What puzzles me most is that, after stopping on the hill for a moment, a slight push starts the engine again, and it takes the hill satisfactorily. I should be extremely obliged if you could help me, as a local garage can only suggest a larger jet, which, seeing the hill failure is a recent development, can hardly be the source of the trouble.—J.H.B.

The trouble is probably due to the use of an unsuitable plug, which causes pre-ignition and the engine to behave in the manner described in your letter.

Scott Timing and Lubrication.

Q. I have a 1916 Scott, and I should be glad if you could put me right on two things. The first is I can get the right-hand cylinder to fire quite regularly, but the left will not fire at all, although everything seems all right, including the ignition. The second is I do not understand the mechanical lubricating system.—W.C.S.

The correct timing is as follows: begin with the left-hand cylinder, see that the piston is at the top of the stroke, and the contact breaker fully retarded. The platinum points should then be fully broken on the back segment. The rear high-tension wire should go to the left-hand cylinder. This applies to the Bosch magneto. The failure of the left-hand cylinder to fire is probably due to an air leak or defective crank case compression. The lubrication system is fully described in the Scott handbook. We presume your machine is fitted with a drip feed lubricator. Oil can run through to the crank case when the crank is in one position only, that is, the vertical, as the slot in the gland controlling this coincides with the oil-hole at this point, which is arranged so that at a particular moment the vacuum in the crank case is at its maximum, which occurs just prior to the inlet port opening to the carburetter, consequently the maximum quantity of oil can be sucked in. If the machine is in good order and no leaks occur at the oil pipe unions the suction is sufficient to operate the oiling, and all that is necessary is to regulate it by adjustment of the lubricator screw.

The pump plunger can be fixed in a down position by the clip provided, and can be instantly released should an extra amount of oil be required, the spring underneath the plunger putting pressure on the column of oil in addition to the suction.

Overheating.

Q. I recently purchased a 2½ h.p. two-speed, 1915 model Allon. This machine runs excellently on the level, and I have no difficulty in starting up. I have checked the timing, and it is correct: I give a fairly rapid drip of oil, but there is a great falling off of power on hills; even changing to bottom speed does not improve matters, as the machine usually peters out within 100 yards. There is no difficulty in restarting, and it usually manages the rest of the hill. The petrol level is correct. (1.) What is the cause of the trouble? (2.) Can I fit a more efficient silencer without impairing the engine's efficiency? (3.) If well tuned, will this machine take a featherweight sidecar?—L.P.J.

(1.) Evidently you are using too large a jet; also try a plug which is specially designed for two-strokes. New piston rings, which are too tight, may have been fitted. (2.) We are afraid you cannot alter the silencer without impairing efficiency. (3.) The engine in question is not suitable for serious sidecar work.

Running on Benzole.

Q. I have tried running my motor cycle on half benzole and half No. 3 petrol, and find it better on hills than No. 3 alone. Some people say benzole, even if thus diluted, will corrode and eat away the inside of the tank in time, while others say benzole used alone does no harm. (1.) By using half benzole and half No. 3 petrol, is there any danger of my tank being corroded inside? (2.) Would any harm be done to the engine or carburetter? (3.) Would it overheat the engine? (4.) Is there any guarantee that benzole bought has any harmful ingredients removed?—V.Q.

(1.) We should not think there is the slightest danger of corrosion in your tank; (2) or any harm to your engine or carburetter; (3) or overheating through the use of benzole. (4.) A standard of benzole has lately been adopted, and if the benzole is found to contain any harmful ingredients the matter should be reported to the National Benzole Association, Horseferry Road, Westminster, London, S.W.1.

Typical war-worn motor cycles offered for sale by auction. The majority of above are minus tyres and generally in a dilapidated condition.

The Result of Neglect.

[?] I have a 5 h.p. Indian, 1915, the left twist handle of which is practically immovable (the machine has been standing for 2½ years), except by using great force. I intended, therefore, to dismantle it in order to put matters right. Although I have taken the small screw out, I have not been able to get the twist handle off. I should be greatly obliged if you could tell me how to do it.—B.H.

The rubber grip is fitted on to a metal sleeve which goes over the handle-bar. The grip should be soaked in boiling water for five or ten minutes, when it can be twisted off. This will expose the nut which holds the sleeve to the inner control rod. The metal sleeve must then be removed together with the tube and cap at the front of the bar where the universal control is fitted. The cap is held in position by a small cheese-headed screw. After the removal of these parts, the control can be pulled a short way through the handle-bar at the forward end, and the universal joint can be detached by knocking out the rivet. This will allow the controls to be pulled out from the grip end.

A Cracked Crank Case.

[?] (1.) Would a cracked aluminium crank case be detrimental to hill climbing, etc.? (2.) Would it be possible to cause loss of compression in a four-stroke motor cycle engine? (3.) Could the crank case be repaired by oxy-acetylene, or electric welding, or by any other means? (4.) Could you give a rough estimate of the cost of the repair? (5.) Is a 3½ h.p. combination, with two-speed Roc gear, capable of carrying 27½ stone weight, over average roads, say with 19 stone on the motor cycle and 8½ stone in the sidecar?—W.W.

(1.) While the fact that the crank case is cracked could not be said to be

detrimental to the running of the engine, it is always possible that the crack may develop and cause serious trouble, and also that the oil may leak from the crack and a seized engine might result. (2.) Certainly this would not cause loss of compression in a four-stroke engine. (3.) It should be possible to weld the crank case. We should recommend you to get into communication with the following firms: Barimar, Ltd., 10, Poland Street, London, W.1; and the Oxygen Welding Works, Ltd., 44, New Summer Street, Birmingham. (4.) We regret to say we cannot give you an estimate of the cost. (5.) We should say that the machine would be distinctly overloaded.

The Low-tension Magneto.

[?] In 1916 I bought an N.S.U. for £11, and used it for about six days, when I was called up for service. It ran all right then, but was rather difficult to start; it has an accumulator magneto, B. and B. carburetter, and a 3½ h.p. single-cylinder engine, which pulls splendidly. From what I can gather from your book, "Motor Cycles and How to Manage Them," I should say it is good enough to learn on. Do you think it would be worth while to have an up-to-date magneto fitted on this machine? The present one is in front of the engine and is driven direct, but is worked by an accumulator in the front part of the tank. I am going to do as you suggest in your book—get familiar with the working of a motor cycle and then go in for a really good machine, and a new one.—C.I.

As you bought the machine cheaply it would be well worth keeping to learn on. The existing magneto should be quite satisfactory, though it is clear you do not understand its working. It is a low-tension magneto, the current from which is raised to a high-tension by a coil carried in the tank, not by an accumulator, as you suggest.

RECOMMENDED ROUTES.

DERBY TO HITCHIN.—S. DU R.

Derby, Castle Donington, Loughborough, Leicester, Market Harborough, Kettering, Higham Ferrers, Bedford, Shefford, Hitchin.

CARDIFF TO WOLVERHAMPTON.—H.E.J.

EDMONTON TO BOURNEMOUTH.—T.B.R.

Edmonton, Seven Sisters Road, Camden Town, Albany Street, Marylebone Road, across Edgware Road, Oxford and Cambridge Terrace, Bayswater Road, Shepherd's Bush Road, Hammersmith Bridge, Castelnau, Barnes, Roehampton, Kingston Hill, Kingston, Surbiton, Thames Ditton, Esher, Cobham, Ripley, Guildford, Hog's Back, Farnham, Alton, Winchester, Romsey, Cadnam, Lyndhurst, Christchurch, Bournemouth.

PATROLS and CAR THIEVES.

The A.A. patrol does things outside the province of other guardians of public interests, and the present epidemic of motor car thefts discloses additional evidence of his real utility.

A member
loses his car or motor cycle,
either after leaving it standing for a few minutes, or from his private garage during the night. He may notify the police, but his most practical course is to telephone particulars immediately to the nearest A.A. office.

As soon as this information is received by the Association, a full description of the stolen vehicle, i.e., make, horse-power, colour, registered number, and other essential details is telephoned to the A.A. Branch Office and all the A.A. roadside sentry box telephones.

The patrols in charge, in turn, pass the information to all other patrols in their districts, or these men may receive telegrams from A.A. Headquarters.

The hue and cry is raised!

It is one of the ordinary duties of the patrols to record the numbers of all the cars and motor cycles

they see on their beats. It is, therefore, practically impossible for a stolen vehicle to be used on a road patrolled by the A.A. during daylight, without leaving clues concerning its whereabouts.

Cases are on record where the watchfulness of the patrols has resulted in a ring fence being drawn round the thief, and he has been driven to

abandon the car on the road,

with an empty fuel tank, for, in addition to tracking the thief, the patrols pass their information to garages, thereby rendering it difficult for the thief to obtain petrol or other supplies

When the car is seen, "necessary action" is taken for bringing it to a standstill. If such action is unsuccessful, the patrols use the wires running between the A.A. roadside telephones, and the

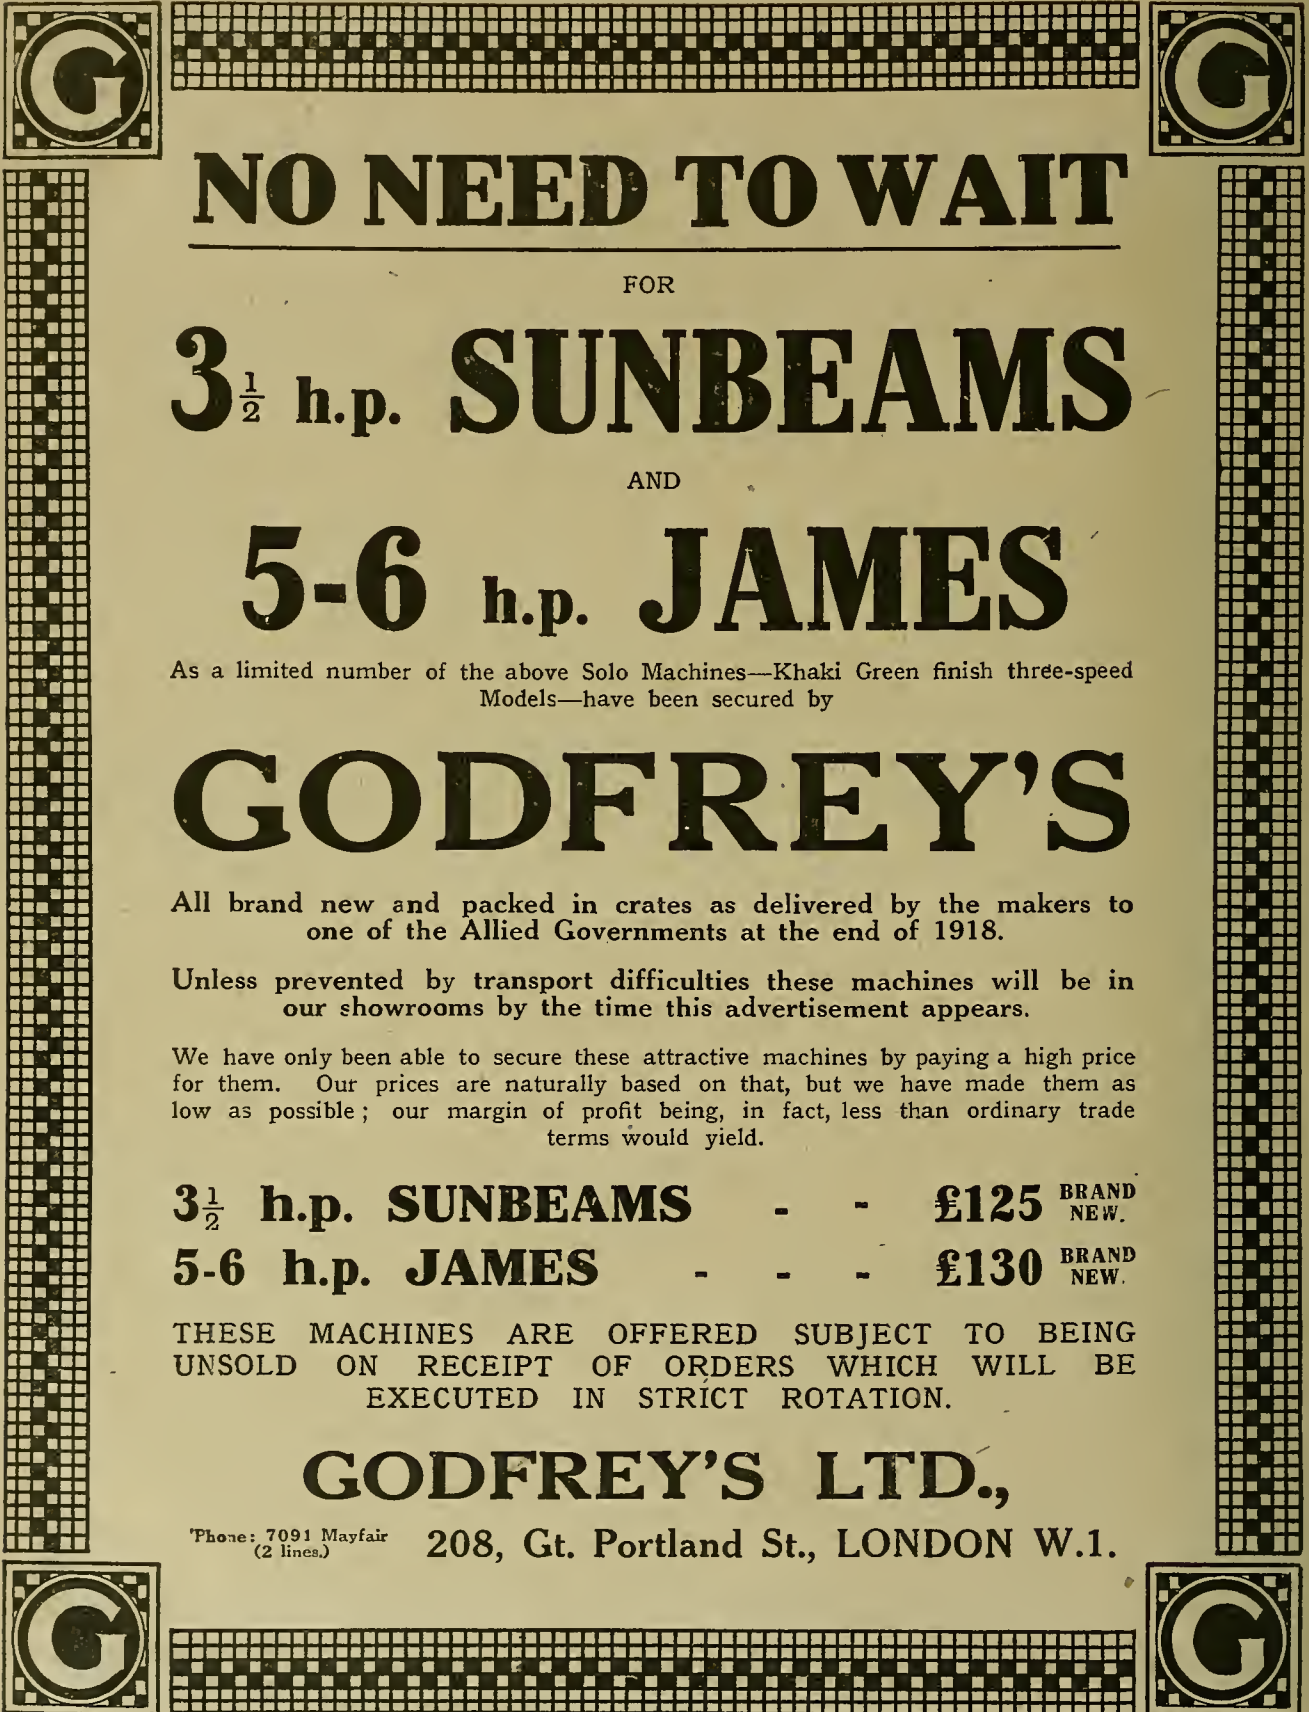

thief's progress is ultimately arrested,

unless he leaves the main road.

A.A. patrols are the "special police" of British motoring. While motor car thefts are rampant, the wise motorist will join the Automobile Association, and become entitled to their services in this connection, and benefit by the thousand and one other unique services afforded by membership of the A.A.

Every motorist who desires information as to the other privileges enjoyed by the members of the Automobile Association should read the booklet, "The Key to the Open Road," a copy of which can be obtained from the Secretary, A.A. & M.U., 21, Fannum House, Whitcomb Street, London, W.C.2.

NO NEED TO WAIT

FOR

3 $\frac{1}{2}$ h.p. SUNBEAMS

AND

5-6 h.p. JAMES

As a limited number of the above Solo Machines—Khaki Green finish three-speed Models—have been secured by

GODFREY'S

All brand new and packed in crates as delivered by the makers to one of the Allied Governments at the end of 1918.

Unless prevented by transport difficulties these machines will be in our showrooms by the time this advertisement appears.

We have only been able to secure these attractive machines by paying a high price for them. Our prices are naturally based on that, but we have made them as low as possible; our margin of profit being, in fact, less than ordinary trade terms would yield.

3 $\frac{1}{2}$ h.p. SUNBEAMS	- -	£125	BRAND NEW.
5-6 h.p. JAMES	- -	£130	BRAND NEW.

THESE MACHINES ARE OFFERED SUBJECT TO BEING UNSOLD ON RECEIPT OF ORDERS WHICH WILL BE EXECUTED IN STRICT ROTATION.

MOTOR CYCLES FOR SALE.

Brown.

BROWN, $3\frac{1}{2}$ h.p., 3-speed, twin, free engine, wicker sidecar, in good running order and condition; £32.—T. Lucas, jun., Gas Works, Long Breckby, Rugby. [X2377]

B.S.A.

B.S.A.—Early deliveries from Turner Bros., 134, Upper Thames St., London, E.C. [2843]

NEW B.S.A.'s; repairs, overhauls, spares; any make supplied.—Alexander, Agent, 108, Wallasey Village. [1506]

1 b.p. B.S.A., clutch model, good condition; £36. 32 —Evenings, 74, Dollis Park, Church End, Finchley. [2761]

4 1 h.p. 1916 B.S.A., 3-speeds, chain-cum-belt transmission; 60 gns.—Wanchope's, 9, Sboa Lane, London. [2856]

B.S.A., 1913 clutch model, excellent condition, little used; £45; after 6.—6, Claverley Villas, Finchley, N. [2671]

JONES' Garage, special agents for B.S.A., Broadway, Muswell Hill, N.10, and Woodside Parade, North Finchley. [2919]

FOR SALE, B.S.A. $3\frac{1}{2}$ h.p. combination, 1915, free engine, 2 speeds, little used; £80.—Williams, Stanford-in-the-Vale, Berks. [2702]

B.S.A. 1919 Models. Deliveries commence shortly. Book up now.—George Smith's Motor Cycle Depot, Clapham Junction. [3034]

B.S.A. 1915 Combination, coach, 2 speeds, k.s., new condition, perfect order; £74, bargain.—53, Russell Rd., South Tottenham. [2394]

19 14 B.S.A., Tourist Trophy Model, stored since 1916, fine condition; best offer over £35 secures.—82, Balaam St., Plaistow, London, E. [2992]

B.S.A. Combination, 1914, stored 2 years, 2-speed clutch, tyres and belt, new; £85, spot cash, no offers.—Taylor, 54, Bishop St., Shrewsbury. [2611]

B.S.A. 1915 $4\frac{1}{2}$ h.p., 3 speeds, countershaft, clutch, K.S., all-chain, like new; seen running; offers.—Acacia House, Centre Av., Acton (side door). [2968]

19 16 B.S.A. $4\frac{1}{2}$ h.p. 3-speed Combination, suitable for tradesman, or without body, perfect; £80.—Agar, 34, St. John's Terrace, Sutton-at-Hone, Kent. [X2276]

B.S.A., $4\frac{1}{2}$ h.p., late 1913, single-gear model, stored during war, guaranteed perfect running order; accept £35, quick sale; silence negative.—Owen, Colyton, Devon. [X2210]

19 19 B.S.A. Model K, coachbuilt sidecar, P. and H. lamps, speedometer, horn, not done 600 miles; best offer over £105; seen only by appointment.—H. Bagott, 48, Broad St., Oxford. [X2215]

B.S.A., all-chain, 3-speed, kick start, coachbuilt sidecar, lamps, horn, done about 800 miles, as new; only wants seeing; £110, bargain.—Smith, 3, Parade, Staines Rd., Bedford, Middlesex. [2590]

LATE 1916 B.S.A. Combination, coachbuilt sidecar, speedometer, Klaxon, P.H. lamps, all accessories, splendid condition, little running; 80 gns.—Pennington, Berkeley House, Lymington, near Folkestone. [X2600]

B.S.A. 1915 $3\frac{1}{2}$ h.p. Combination, 3-speed, clutch, kick start, new belt and spare, O.B. sidecar, nearly new, new tyre and tube, splendid running condition; trial; £95.—Whait, Craven St., Melton Mowbray. [2750]

B.S.A., $4\frac{1}{2}$ h.p., late 1914, all chain, coachbuilt combination, 3-speed countershaft, lamps, speedometer, etc., stored 2 years, excellent condition; 85 gns.—Watkins, 2b, Morgan Mansions, Holloway, N.7. [2955]

19 19 B.S.A., $4\frac{1}{2}$ h.p., 3-speed, chain-cum-belt, model K, complete with Lucas lamp set and horn, first-class condition, ridden 300 miles, owner leaving district; what offers?—Box 4,009, c/o The Motor Cycle. [X2329]

B.S.A., 3-speed, K.S., late 1915, K., chain and belt, new gear box, good tyres, Lucas set, mechanical horn, reliable machine, go anywhere; £65; no rubbish; exchange Triumph or Norton.—Box 4,620, c/o The Motor Cycle. [X2560]

B.S.A. Combination, 1915, 3-speed, chain-cum-belt, fully equipped, speedometer, etc., perfect condition, mileage 9,000, 160 miles 2 gallons 21st May, tyres as new; £89.—Izzard, 585, Green Lanes, N.8. 'Phone: Hornsey 2214. [2491]

B.S.A., 1919, 3-speed, $4\frac{1}{2}$ h.p., countershaft gear, chain-cum-belt, not done 300 miles, only delivered from works last month, as new; £83/10, no offers; owner giving up.—Draper, Rottingdean, near Brighton, Sussex. [2528]

19 19 B.S.A., $4\frac{1}{2}$ h.p., Model K, as new, with horn, delivered March, not done 300 miles, Dunlops, with No. 4 Bowser coachbuilt sidecar and apron, delivered April, all perfect condition, guarantees and receipted bills shown; appointment, trial; £107.—Colman, 36, North Bailey, Durham. [X2217]

B.S.A., 1917, $4\frac{1}{2}$ h.p., chain-driven, 3-speed, B.S.A. countershaft clutch, K.S., E.I.C. magneto, tyres as new, Chater-Lea light coachbuilt sidecar (will separate), splendid condition throughout; thorough trial given; £100, or best offer spot cash.—61, Railway Approach, East Grinstead. [2982]

B.S.A.—The Birmingham City agents and specialists who confine their business absolutely to B.S.A. manufactures always holds the most complete stock of motor cycles, sidecars, bicycles, etc., and can give immediate delivery of all replacements.—The Conny Cycle and Motor Co., 507-8, Broad St. 'Phone: Midland 753. MOTOR CYCLES FOR SALE.

B.S.A.

B.S.A. $3\frac{1}{2}$ h.p., 1913, 2-speed, free engine, pedalling gear for starting, stored greater part war, recently overhauled, splendid condition, complete with new electric lamp, electric horn, batteries, tools, pump; trial on deposit of amount; owner has car; bargain, £60 cash.—Kennard, Dumption House, Ramsgate. Tel.: 374. [X2355]

Calthorpe.

CALTHORPE Junior, Precision 2-stroke, 2-speed; £30.—82, Downs Park Rd., Hackney Downs. [2780]

CALTHORPE 2-stroke, 2-speed, perfect order; £37/10.—134, Cherry Orchard Rd., Croydon. [2741]

CALTHORPE Combination, 8-10 h.p., torpede sidecar, condition as new; £110.—Melrose, 1, Kenlor Rd., Tooting. [2949]

CALTHORPE, 1918, 2-stroke, lady's, Enfield 2-speed, as new; 52 gns.—Church House, 16, Maida Hill West, W.2. [2705]

CALTHORPE-J.A.P., 1916, $2\frac{1}{2}$ h.p., Enfield 2-speed, splendid condition; £47.—Spalding, 4, High St., Chelmsford. [2663]

19 16 Calthorpe-Jap, $2\frac{1}{2}$ h.p., 2-speed, just overhauled; letters only; first cheque secures.—7, William Place, Enfield. [2636]

CALTHORPE Junior, Precision, 2-speed, free engine, fine condition, all accessories, ready ride away; £35.—87, Truro Rd., Wood Green. [X2463]

CALTHORPE-J.A.P., $2\frac{1}{2}$ h.p., in perfect order, just been overhauled, Enfield 2-speed, all accessories; £40, no offers.—After 6 p.m., 10, Bisham Gardens, Highgate Hill. [2471]

CALTHORPE-J.A.P., 1915, $2\frac{1}{2}$ h.p., Enfield 2-speed, F.E., new tyres, recently overhauled, splendid condition throughout; £37; appointment.—61, Ellerton Rd., Surbiton. [2657]

19 17 Calthorpe-Jap $2\frac{1}{2}$ h.p., Enfield 2-speed, 2 generators and lamps, mudshield, special carrier, spare belt, etc., good condition; £50.—Pengelly, Trinity House, Abingdon, Berks. [X2558]

Campion.

CAMPION-PRECISION lightweight, 2-speed, good condition; £25.—Sgt. Errington, A.O.C. Hut, Lydd Camp. [2675]

2 1/2 h.p. Campion (Jap), 2-speeds, chain-cum-belt, excellent condition; £40.—Reeves, Guildford Rd., Farnborough, Hants. [2676]

CAMPION-J.A.P., $4\frac{1}{2}$ h.p., 2 speeds, free engine, condition perfect; £40.—Taylor, Brownlow Cottage, Pleasington, Blackburn. [2799]

CAMPION-J.A.P. 8 h.p., 1918 model, all-chain drive, 3 speeds, and O.B. sidecar, in perfect order, and little used; £125.—Raynam, Saffron Walden. [2891]

19 16 Campion 6 h.p. Combination, J.A.P. engine, 3-speed, countershaft, kick start, fully equipped, new tyres, splendid condition; after 6 o'clock; no dealers; £118.—317, Camden Rd., Holloway. [2662]

19 15 Campion Motor Cycle and coachbuilt sidecar, $4\frac{1}{2}$ h.p. Precision, B. and B., Jardine countershaft, chain, 2 speeds, free engine, kick start, good running order; 85 gns.—C. W. Hamel, 8, Park Rd. North, Bedford. [X2268]

19 15 Campion $4\frac{1}{2}$ h.p. Precision Combination, 2-speed, K.S., chain drive, Bosch mag., Millford sidecar, plating as new, perfect condition; £110.—Bampton, 132, Herrick Rd., Loughborough, Leicestershire. [2833]

Centaur.

3 1/2 h.p. Centaur and Sidecar, Mabon clutch, Bosch 32 mag.; £28.—Stanley, 56, Montague Rd., Cambridge. [X2604]

3 1/2 h.p. Centaur, chain drive, lamps, horn, etc.; £27. 32 —9, The Parade, Cambridge Rd., Northampton, Surrey. [2640]

CENTAUR, 1913 5-6 h.p. Twin, N.S.U. 2-speed, Bosch, B. and B., good tyres; £38.—12, Temple-sheen Rd., East Sheen, S.W.14. [X2594]

CENTAUR, T.T., $3\frac{1}{2}$ h.p., 2-speed, Dunlops, Bosch, B. and B., condition like new, been stored 2 years; bargain, £50.—23, Chapel St., Ulverston. [X2397]

Chater-Jap.

4 h.p. Chater-Jap, Bosch, 2-speed; £45.—47, Queen's Terrace, Newcastle. [X2372]

3 1/2 h.p. Chater-Jap, B.B., Bosch, new belt, tyres nearly new, variable pulley, take 2 up Reigate, in splendid condition; £45, a snap.—Jonas, 882, Garratt Lane, Tooting. [2887]

£85, or near offer.—8 h.p. Chater-Jap coachbuilt combination, 3-speed, clutch, handle start, all lamps, accessories, perfect running order.—After 8 p.m., 67, High St., St. John's Wood, N.W. [2603]

REPAIRING

"Elite Holdite Rivetless Soles."

Soles STUCK ON.—

We are now placing on the market an entirely new and patented Rubber Sole. These soles are specially prepared with an adhesive surface, and fixed with Elite Holdite Sol-fix solution. We guarantee them to hold as firm as rivets or sewing. The process of fixing is exactly the same as that of repairing a punctured Motor or Motor Cycle tube. One of the many great advantages of our process is that the Boots or Shoes when fitted with our soles become **absolutely waterproof**. Full instructions given with each pair of soles.

PRICES:

Gents'.

FORWARD

PLUGS.

An abundance of unsolicited testimonials from users of Forward Plugs—of which there's a type for every engine—confirms our claim that they are stronger and will stand up under harder usage than any other make—let us send you details of all our various models.

Telling Testimony to the Forward Fastener

Price 1/6.

Read this. It comes from a customer at Stoke-on-Trent.

"About three years ago I sent for one of your FORWARD Belt Fasteners for my (Big Six) Motor Cycle Combination. Up to that time I had tried almost every make of fastener, but every one failed. Almost every time I went out I broke a fastener, and I got downright sick of it. So you will understand how pleased I am to say that since I put in your Forward I have never had a break."

If you want a cheaper but excellent Fastener, there is

THE KING HOOK.

Price 1/- or adjustable 1/3.

FORWARD SPARKING PLUG Co., SUMMER ROW, BIRMINGHAM.

The Holiday Spirit.

True happiness depends upon Freedom from Worry.

TO many hundreds of motor cyclists the pleasure of the Whitsuntide ride or tour will be in great part due to the fact that their

Sturmey-Archer or Armstrong Gear

has been repaired by us, and is consequently as reliable as when it was fitted.

WE specialise on the repair of Sturmey-Archer and Armstrong Gears, and have a large stock of tested parts for replacements.

RECOMMENDED BY THE STURMEY-ARCHER Co

We have been kept very hard at work since the armistice in remedying gear troubles for motor cyclists, and we are looking forward to a short rest at Whitsuntide, but after the holidays we shall again be at your service,

so—

A Pleasant Holiday to Every Motor Cyclist,

but, in case you should have gear troubles, make a note of the address—

COUNTY ENGINEERING CO.

HOBART CYCLE CO. LTD
HOBART WORKS
COVENTRY. ENG.

A NEW THING IN MOTOR CYCLE MAGNETOS.

The SIMPLEST and LIGHTEST
High Tension MAGNETO yet produced
is the

RUNBAKEN
W.L. 1 TYPE MAGNETO.

: WEIGHT ONLY 3lbs. 8 ozs. :

DIMENSIONS: Height 106 mm., length 106 mm., over all.

The introduction of the RUNBAKEN W.L.1. type makes it no longer necessary to fit a Magneto nearly as big as the engine.

By eliminating all unnecessary parts, we have produced a Magneto specially suitable for small, light engines up to 2½ h.p.

Thoroughly efficient, it sparks regularly from the lowest speed up to 5,000 revs. per minute.

It gives a powerful spark as soon as the armature commences to rotate, ensuring easy starting.

Entirely dust-proof and water-proof. Will work without variation under water.

MINIMUM WEIGHT—MAXIMUM PERFORMANCE.

Telephone: Full particulars from Telegrams:
City, 8266 THE RUNBAKEN MAGNETO CO., LTD. Runmag,
(3 lines.) Cheetwood Lane, Derby St., MANCHESTER. Manchester.

ADVANTAGES OF ALLDAYS "ALLON"

No. 2.—STRENGTH.

The above illustrates the original and distinct frame of the "ALLON" (2-stroke) MOTOR CYCLE. The outstanding feature of the design is that

No bent tubes are used.

With a Motor Cycle like the "ALLON"—where speed is combined with lightness—strength is absolutely essential, and here you have it. Our Engineering reputation of 250 years is a guarantee that the workmanship is as perfect as the design.

Price, complete with 2-speed Gear, Hand-operated Clutch, and Kick Starter **£65**

Finding a Winner.

SINCE competitions have been resumed there has been no general support on the part of manufacturers, but probably we shall see the re-entry of the "trade" rider in some of the important events before the A.C.U. Six Days Trial in September, provided such events offer sufficient inducement for the manufacturer to enter.

There is no doubt that the majority of makers are far from enthusiastic where trials are concerned, and this is not entirely because they are apathetic. Far from it, the average manufacturer realises the importance of competitions as a means to prove the efficiency of his product in public test. But there are indications showing that "the trade" is now loth to spend money and time on trials in which the majority of competitors secure gold medals and the winners of the premier awards are determined by the watch. In other words, to revive the interest of the maker, organisers must make the winning of a trophy or a medal an achievement which will be recognised as something out of the ordinary, and this without imposing conditions upon competitors which are quite irrelevant to the efficiency of the machines and depend solely upon the skill of the riders.

In the future, therefore, it would appear that there will be two kinds of trials—the sporting competition designed to attract the private rider and the more serious event, or real reliability test. No doubt the A.C.U. trials of the future will be on the lines of the latter, and one or two clubs are also seriously considering the elimination in trials of the unpopular secret check and speed-judging competition.

The Knock-out Trial.

It is obvious that such trials must be somewhat arduous, and that survivors will be few, but strenuous conditions are necessary for modern machines. It has been proved by the results of

recent trials that if "reliability" merely means riding to a 20 m.p.h. schedule over almost any class of road, including what would have been regarded as freak hills a few years ago; then there remains nothing to be proved. Most modern machines are capable of doing all that such trials demand of them, and it is only the element of luck causes retirements. But there are points which have not been so fully developed as is possible, and which affect the general efficiency of the machine for utilitarian purposes. These points include improved braking systems, greater flexibility, and the ability to stop and restart under all ordinary touring conditions.

Awards on Merit Only.

The first trial to be organised on the lines we have indicated will be held this month under the auspices of the Midland Cycle and Athletic Club, who are to be congratulated upon their enterprise in an honest endeavour to find a winner for the premier award entirely on points of merit, and we welcome this old club into the field of motor cycle competitions as an organisation more than usually alive to the necessities of the present day. This trial, which is referred to in this issue, is a most ambitious undertaking for a single club successfully to handle, but the enthusiasm displayed by the organisers leaves little doubt as to its success.

It is significant that many members of the "trade" are assisting in organising the trial, which fact reveals the desire of manufacturers to make a trial which will be worth while, and the winning of premier award something of which to be proud.

The competition should attract a large number of trade entrants, as we have never found the manufacturers lacking in confidence when a gruelling test for their machines has been suggested. In addition, the trial will have a strong appeal to the many enthusiastic motor cyclists who usually enter competitions from the sporting point of view.

AN AMERICAN NEWS LETTER.

Trade Governing Competitions. Road Records Barred.

THE Federation of Motor Cyclists, the body which controlled the sporting side of motor cycling in America, has died of dry rot after a spectacular career of sixteen seasons. In its place U.S.A. riders have the Competition Committee of the Motor and Allied Trades' Association. The new body will regulate competition of all sorts in motor cycling, but will not attempt to knit the riders together for social intercourse or to combat adverse legislation.

The M.A.T.A. has ruled that all eight valve and ported motors are barred from mile tracks; that a stock machine is one that may have anything done in the way of tuning, but changing bore, stroke, or compression ratio is barred; that an endurance run is 250 miles long, and that there are no longer amateur and professional riders. American motor cyclists are now novices or experts, with the single exception of a track professional. Once a motor cyclist has ridden for a cash prize he becomes automatically a professional. A novice is a trade or private owner who has never won a leading prize in a motor cycle competition. Riders are classed according to ability and not according to their trade or profession. Thus, a sporting dealer is not made a professional when he competes for the sheer love of the sport. Road record trials are officially taboo.

An Endurance Record.

Roy Artley, of California, recently broke a much coveted record in the West. He drove his Henderson solo mount 394 miles in 13h. 10m., taking 70m. off the old Indian record. Artley broke his forks within sight of his goal, replaced them, and made the reverse trip in record time.

The veteran Baker, one of the best

Scenes at an American hill-climb at Dover, N.J. In America gradients are found which are almost impossible to ascend, and prizes are awarded to those who reach the highest point.

long distance riders (who holds the twenty-four hour track solo record of 1,675 miles), wants to regain his Transcontinental mark and the Three Flag Dash time. These are held by the Henderson and Excelsior, the coast to coast being six days 6h. 16m., while the Three Flag, from Canada to Mexico along the Pacific Coast, is held by Bennett, 70h. or so for 1,600 miles. All but a few hours of that is non-stop, too.

The third annual Capistrano hill-climb in California, by the way, was the most sensational event of its kind in the world, for it is a 500 foot grade with a finishing slant that pokes up toward heaven at the angle of 75%—not estimated, but measured.

The Excelsior repeated its annual victory with a win in the stock class, while the Harley-Davidson broke into the winning column at this hill by capturing

the "free-for-all." The hill requires tractor bands on the rear wheel to aid in making the grade.

In addition to road activity, there is talk of a 250 mile track race at Los Angeles this month; two speedway race meets on the Fourth of July; a 14.5 mile course has been selected for an American Tourist Trophy Race out near Denver, Colo., for sidecars only; and several clubs are bidding for the National Endurance Run Championship.

Clubs are springing up all over the United States, while the dormant organisations are receiving an injection of new life.

And while this is happening among the riders, the factories are far behind in their orders and are getting slower in deliveries daily. Maybe, Ford will bring out that £50 peace chariot of his. Maybe he will; but it does not seem to worry anyone at present.

E. B. HOLTON.

WHEEL DISCS WITH FLANGE FIXING.

THERE is no doubt that wheel discs are increasing in popularity among motor cyclists, as, apart from their eliminating the necessity to clean the spokes, they give a machine a sporting appearance, which, just now, is the "fashion," and likely to remain so for some time to come.

A new wheel disc, which is bound to attract attention, is being offered to the motor cycling public by the Coventry Disc Wheel Co., of Whitefriars Street, Coventry. It is extremely neat, being made without a joint, and the usual method of fixing by nuts and bolts near the periphery is unnecessary.

The disc is cut by machinery and joined by welding, making a perfectly invisible joint, and at the centre there is a brass flange having three holes. The pair

of discs are connected by means of three long $\frac{1}{4}$ in. bolts, which draw the flanges together and so fix the discs firmly against the wheel rims.

The Ace wheel disc, showing the flange fixing and method of pocketing the valve.

Another feature of this disc, which is to be known as the Ace, is the method of exposing the valve. This is shown in one of the illustrations, from which it

will be seen that a recess is provided in one of the discs which pockets the valve in such a way that no gap is left through which dust can permeate.

The manufacturers hope to produce these discs to sell at £1 per wheel set, and intend making a speciality of equipping sidecar outfits. The standard finish will be in black enamelled with plated centre flanges, but colours will be optional, and aluminium discs will also be manufactured.

Mr. E. R. Lloyd, late R.A.S.C., M.T., who, before the war, was with the Singer Co., is manager of the company, which, very shortly, will be in a position to make the discs in quantities.

Occasional Comments

by "Ixion"

How to Avoid Skids.

A CORRESPONDENT of the *Cologne Post* (the paper published for our Army on the Rhine) finds the German roads very provocative of side-slip when wet. He warns fellow despatch riders that the risk of skidding is vastly reduced if the rider puts his whole weight on the footboards when traversing a dangerous patch of road. The sports editor of the said journal takes the opposite view, and informs his correspondent that "the higher the weight on the machine, the less likelihood there is of the wheels slipping" from under the rider. *A fortiori*, if a tennis umpire's scaffold chair were substituted for the ordinary saddle, side-slip would die a natural death. The sports editor should conduct experiments to discover what difference in stability would result if the rider (a) sat on a saddle pin which would raise him 12ft. from the ground line, or (b) stood on the footboards wearing stilts which would hoist his body to a similar height. For me, a wide pair of handle-bars and a saddle well forward are good enough; I like the saddle as low down as I can get it, and I never stand on the footboards except when I see I cannot escape running over a very fat man or at level crossings.

Baking the Sparking Plug.

I WONDER where the Rev. J. M. Philpott picked up his tip of heating the sparking plug to overcome the coyness of a cold engine at starting time. If he has independently re-invented it as a *tour de force*, it may interest him to know that it has long been quite a popular dodge amongst air mechanics. For example, I understand that at the Sunbeam-Coatalen aero engine test shop, it is a routine practice to keep the plugs in special racks and to put each rack into an oven shortly before its engine is due for starting. I should be interested to hear a technician discourse on the exact reason why a hot plug should ensure an easy start from cold, as it always does. It is too remote from the carburetter to affect vaporisation of the complete charge very materially, nor can it raise the temperature of the combustion chamber very appreciably. Are we to understand that a very few degrees of heat make all the difference in a start from cold, or that the bridging of the plug gap by a bead of condensed moisture is commoner than most of us have suspected? At any rate, whatever the reason may be, I can vouch for the soundness of Mr. Philpott's recommendation.

Getting Nearer to It.

I HEARTILY congratulate the Douglas designers on their new $3\frac{1}{2}$ h.p. For one thing, it does not flaunt its springs; a couple of big rear laminateds are a trifle too obtrusive, and are apt to cock up the stern of the machine till it reminds one of the bustle in a mid-Victorian skirt. What is more to the point, the machine is light. It is a fully-sprung $3\frac{1}{2}$ h.p. at roughly two hundredweight. The A.C.U. has very

seldom nerved itself to publish the actual running weights of the machines entered for its trials; but some years ago I concealed my diminutive figure in their scale room, and can testify that in those days the average weight of an unsprung $3\frac{1}{2}$ h.p. with a single gear or variable pulley was over two hundredweight. Since then weights have shown a steady increase, what with spring frames, full chain drive, three and four-speed gear boxes, chain cases, and frames supposed to be sidecar-proof. The new Douglases evidently intend to reverse this deplorable process. There are numerous laudable details in the layout. You get your lamp bracket thrown in instead of having to pay some shark of an accessory dealer half a guinea for a fitting which never blends into the outlines. You cannot mistime your magneto. The piston has definitely broken with the "maximum-friction" type so universal in 1914. Getting the engine out is not comparable with the 500-piece jigsaw puzzles so popular in military hospitals. Mud shielding is not forgotten. The design shows happy co-operation between practical riders and sound engineers.

Service.

IT is an almost incredible fact that the average motor cycle manufacturer arranges no organised local "service" for his customers in England. Until quite recently you could break an exhaust valve of any leading British engine without feeling at all certain that a spare would be obtainable in the next big town. The firm would have an agency in that town, but an "agency" by no means implied a representative stock of spares, *nor does it at this day*. A few makes are in almost universal demand, and in the larger towns a tourist on a sister machine could replace an exhaust valve with tolerable certainty. He could only replace a less vulnerable item, e.g., front wheel spindle, if he had the luck to strike a sensible agent who would remove the required part from a stock or used machine. If the tourist were riding one of the lesser makes of machine, he would not be able to get spares except at the very liveliest and largest agencies. Such business methods are atrocious in the twentieth century. Manufacturers should make it part of their agreement with their "agents" that they maintain a stock of at least one of everything likely to go wrong. I have known an agent refuse to strip a part from a machine in his window to help a stalled tourist along the road. In war, when necessity was our law, the maker of an aero engine was compelled to supply spare parts with each engine delivered, and the kit of spares sometimes amounted in cost and weight to the equivalent of an engine and a half, or even more. I am not implying that a motor cycle engine demands quite such liberal "service" as that; but I note two facts of relevance while I am on this topic.

1. A friend of mine who bought a 1913 Indian

Occasional Comments.—

second-hand the other day has been able to purchase any bits he wanted across the counter at Indian House.

2. One of the mushroom motor cycle syndicates intends to equip all its agencies with a complete kit of spare parts which will not be listed at profiteering prices.

Testing the Compression.

IN the early days of the motor cycling era we used to test engine compression by standing on the pedal and mentally noting how long it took to go down. When advanced design robbed us of pedals, we based our estimates on feeling the back wheel, or on the amount of weight we lost in producing a start. Such rule of thumb methods will not satisfy your *pukka* engineer. Mr. Eustace Thomas, of Manchester, has evolved a childishly simple apparatus for tuning up the compression of his light car. The gadget is of special value where four cylinders are concerned, a single or twin presenting a much easier job; but I describe the instrument in case any fastidious owner is eager to exorcise the tiniest vestige of a leak. The engine is put on the compression stroke, with the compression tap shut, and rubber bungs inserted in the valve ports of the cylinder—i.e., the inlet and exhaust orifices in the head. Pipes threaded through holes in the bungs are suitably bent and led into a vessel containing water, so that the far end of each pipe is under water and beneath an inverted glass bell jar. $\frac{3}{8}$ in. rubber hose is used to couple up the compression tap to an air reservoir, e.g., an old oil tin. This reservoir is provided with a gauge, and is charged with compressed air by a tyre pump, an ordinary tyre valve being used as a non-return. At the commencement of operations the compression tap is shut, and a pressure of, say 50 lb. is pumped up in the reservoir. The compression tap is then opened, and the reduction of pressure down to, say, 25 lb. is timed against the watch, whilst bubbles in the two glass jars show whether there is a leak at either valve, and, if so, whether the leak is great or small. If the external joints, e.g., valve caps, sparking plug, and compression tap, have already been perfected by a series of oil tests, an unusual rate of leakage unaccompanied by bubbles in the glass domes shows that the

piston rings are faulty. Of course, for real accuracy in using such a gadget the operator requires a standard leakage period to work to; until he knows how long the 25 lb. drop in pressure should take with rings in perfect order, he can only work by his "previous best." Mr. Thomas found the apparatus was a regular eye-opener as to the number and obstinacy of the air leaks in the average engine. An Okill gauge will, of course, register the actual compression or explosion pressures of any given engine; but it cannot betray the exact location of individual leaks, as this home-made gadget will do.

Honesty the Best Policy.

TO judge by the letters I receive, some of the second-hand dealers are sharks. I blame no such concern for charging fancy prices in these days. Materials are up. Labour is up. The staffs have in many cases been fighting for us; often at Tommy's pay, goodwill (if any) has evaporated, and the business has to be re-built from the base. An article is worth what it will fetch, and if there is a slump (and there may be) following on over-production it will not be nice for the agents any more than for the factories. So if an agent asks me a price, provided it is market price, I do not complain that it is perhaps even in excess of what the 'bus cost its last owner but four or six years ago. I myself have probably squeezed my employers for a 100% rise in salary, and got it. But it is bad morals and bad business to sell scrap stuff at any but bargain prices; and to sell dud stuff at gilt-edged prices is a short cut to bankruptcy. Motor cyclists as a class

are loquacious individuals. The average Britisher may not be difficult to "have," but he is not shy of telling all and sundry about it afterwards. The firms who are tempted to adopt these get-rich-quick methods will be the very first to feel the pinch when the struggle between the factories to skim the cream of the market is over. Public opinion cannot be defied with impunity. Already—even after a four and a half years' moratorium—seven riders out of ten will answer promptly if invited to name two or three trustworthy second-hand-specialists; and just as promptly if the request is for a black list of wrong 'uns.

THE 8 H.P. DUNCAN—ENTERED FOR THE LONDON-EDINBURGH RUN.

A "home-built" cycle car, constructed by Mr. A. J. Duncan, a Smethwick dental surgeon, in lieu of motoring during the war. The engine fitted is an 8 h.p. J.A.P., which drives, through a Harley-Davidson three-speed gear box, an adjustable countershaft carrying 14in. pulleys. The final drive is by twin belts to belt rims, also 14in. diameter. The rear wheels, apart from the rear axle, are separately sprung (see inset). Mr. Duncan is an old member of the M.C.C., and so great is his faith in his own creation that he entered the cycle car in the London-Edinburgh twenty-four hours' run at Whitsuntide.

How I Took Up Motor Cycling.

By VETERAN.

The Trials and Tribulations of a Pioneer Motor Cyclist.

I HAVE been a motor cyclist for so many years that my earliest reminiscences are rather hazy. But I am quite clear that we regarded the real pioneer riders as quite unspeakable persons. To begin with, they were obviously crazy—just like a healthy boy who prefers collecting beetles to playing cricket, or a youth of twenty who gets married. Worse than that, they were vulgar. The early motor cycles were quite incredibly dirty; and anyhow engineering was not then regarded as a gentleman's hobby. Still, just for the rag of the thing, we occasionally accepted invitations to joy rides from these low, common fellows. In that Pickwickian sense, I sat on a front driven Werner, a $1\frac{3}{4}$ h.p. Minerva, and sundry trikes which vibrated like growlers driven fast over petrified kidneys, and made a noise which was cross between massed machine guns and a chaff-cutter in delirium. Also on a $3\frac{1}{2}$ h.p. Benz Victoria, which rattled off twelve miles in the first hour and took three days to make the return journey. Again, on a $3\frac{1}{2}$ h.p. De Dion voiturette, bonnetless, one front passenger facing two rear passengers, steered by a handle like a tramcar control, minus any reverse, with a very sensitive contact-breaker apparently located in one of the rear hubs, and never seen without a bicycle secured to the rear panel by a clothesline on the "get-home-somehow" principle. I particularly remember the profound scorn and rage with which the University of Oxford watched J. Van Hooydonk rattle tinnily past Carfax on a $1\frac{3}{4}$ h.p. Phoenix.

The Caprices of Fate.

I wasted some years in this unpardonable mood. At last the caprices of fate stuck me down in a little provincial town, with much leisure and no occupation. In despair, I gave serious attention to billiards. On my nightly tramp to the saloon I passed a cycle shop—now extending tentacles over several counties as a multiple garage. In this cycle shop stood a motor cycle, on which the local cyclists disported themselves after working hours. They were not trusted to try it on the road, and they could not bring themselves to buy it. But the salesman allowed them to caulk and worship it, and to mount it on the stand and try and start it. To my dying day I shall recall that nightly vision of whirling legs swathed in heather stockings, the occasional cough from the exhaust, the heft the pedals administered to the rider when it back fired, and the dripping, puffing faces of the men who had tried and failed. Tiring of billiards, I jettisoned my caste conventions, and tried to buy that machine.

I rejoice that I did not, for it had a flat belt drive to a pulley with the diameter of a thimble: and the district was hilly. But the agent asked £10 more than I had got. With that business acumen which has since made me prosperous, I called on the rival cycle dealer. I represented to him that motors had come to stay. That he must go ahead. That—tell it not to the M.T.A.—he must supply me at trade price. He did so. I wonder if any other motor cycle has ever been sold on such terms, viz.

(1.) The vendor to lend me his head mechanic as escort two evenings a week (the mechanic was a racing cyclist).

(2.) The buyer (myself) to garage the machine at the vendor's, so that he could put it in the window, whenever I was not riding it. (No charge for cleaning.)

I had any amount of trouble with that machine. The mechanic usually accompanied me, and, fortified with beer on the longer jaunts, kept up well. He had one sovereign specific for all loss of power—grind in the float needle. When the machine stopped, he overhauled the near side and I the off, search being our sole principle of diagnosis, and a sound one, as a detached wire was generally the trouble. On the carrier was fastened an oil lamp, as we both feared and respected the carbide lamp, which seldom worked. Finally, the engine melted its inside, and, when it was returned from the works, you could not turn the pulley: probably someone had left a hammer in the crank case, or something of that kind; but, after an acrimonious dispute with the vendor, I transferred to the rival cycle dealer.

He had just got delivery of the first $2\frac{3}{4}$ h.p. Excelsior ever seen in those parts—a machine of extraordinary reliability, and with great hill-climbing powers. It had an 80×80 mm. M.M.C. engine on De Dion lines, and, despite a $\frac{5}{8}$ in. V belt and a $4\frac{1}{4}$ to 1 gear, was a great hill-climber. It stopped a promising boom by the Quadrant firm, being more powerful than a 2 h.p. of that make which Tom Silver was just demonstrating. The Excelsior had been well written up by that versatile genius, E. Douglas Fawcett, novelist, chess player, and philosopher, who later achieved some fame by coaxing a 6 h.p. De Dion car up some of the Swiss mountain tracks. I remember calling to yarn motor cycles with him just as the post came in. His den was stacked with chess boards in layers, on each of which an incomplete game was staged. The mail consisted of postcards on which maestros of all nations reported their next move in correspondence matches. I remember my

How I Took Up Motor Cycling.—

Excelsior for three principal reasons. In the first place, it carried me 15,000 miles with no mentionable trouble; though why the single front forks never collapsed in that period, considering how I rode it, is a mystery. Secondly, it devoured belts at an extraordinary rate. On long trips I carried three: and, as you jointed them with miniature meat-hooks, to shorten them on the road was not jam. For years I bore Lycett's a grudge for a belt they sold me at this time. It had metal eyelets an inch apart, so that when it stretched, you merely chopped off an inch and put the hook in a new hole. I was too green to see that these holes weakened the belt unpardonably, and

presumably Mr. Lycett was also in his salad days. I was so charmed with the easy hooking that I bought six, and, looping three round my tank, started out on a grandiose summer tour of 1,000 miles. After about thirty miles, all three belts had snapped and been shortened, and snapped and been shortened, till none of them would meet round the pulleys. So I fell to splicing, until my belt consisted of some dozen short lengths united by meat-hooks. It kept on snapping, varied by falling off and disintegrating into its component sections. Lycett eventually established an armistice by inventing a new hot stuff belt and giving me two or three.

Believe me—those were stirring times.

Judgment in Advertising.

A few Notes by an Old Hand for those who have Machines to Sell.

MANY people appear to possess an appalling lack of judgment in the wording of their advertisements when they have a second-hand machine for sale, not appearing to realise that the proper stringing together of the announcement is vitally important as to whether or not it will catch the eye of intending purchasers. In reading through the second-hand columns, one advertisement at once appeals as interesting; while a dozen others, though practically on the same lines, are passed by hardly noticed, the only difference in *the one* and all the rest being probably in the wording. It strikes you as being open, concise, and as telling you just what you want to know.

Sometimes the most essential points are left out entirely—as, for instance, the year of manufacture of the machine advertised. No more fatal omission could be made, and personally I should never dream of writing to an advertiser who omits to name the date.

Other advertisers waste valuable words, such as "Enfield two-speed gear, clutch," or "P. and M. chain drive two-speed," or "1914 Scott two-stroke," and so on. "Enfield gear" would be quite enough, P. and M.'s have made only one type of machine, and every Scott has

been a two-stroke. Better far to cut out this superfluous wording—for the man who really wants a Scott or a P. and M. or an Enfield knows the fundamental features of the machine—and state instead the condition of tyres, cycle parts, mileage, equipment, and so on.

Skimpily worded advertisements such as "1914 Douglas, two-speed, £45, no offers," do not pay. It is far more profitable to go the whole hog, spend a shilling or two more on the advertisement, and make sure of a proper response first time—rather than having to renew the advertisement, I suppose I have sold at least thirty motor cycles through the columns of *The Motor Cycle* during the last twelve years—machines ranging in value from £20 to £110—and this experience has taught me that it pays every time to "go a buster" on three inserts of a good lengthy kind, concise, open, and as exhaustive as one can afford to be.

Details as to equipment, spares, mileage, the make of sidecar, if a sidecar outfit; in fact, everything that the buyer of a second-hand motor cycle requires to know should also be included.

It is not a bad plan even to quote the engine number in addition to the date, in which case the reader cannot get away from the fact that you are acting genuinely with him, and having drafted out your announcement, concisely but fully, add your rock bottom price and "no offers." CHINOOK.

A family sidecar—a smart 9 h.p. Harley-Davidson outfit seen at a recent club meet near London.

Some Criticisms of Present-day Designs and Constructive Suggestions.

MUCH has been written in the past of accessibility, but at the moment one does not hear quite so much of this very desirable feature.

Now the modern motor cycle is a great advance on that of, say, ten years ago, and, all things considered, is of great reliability. Yet there comes a time when the best mount needs an overhaul, or at least adjustment. When that time comes I wonder what the owners of many of the best known makes of twin and even singles will do. Many will send their machines to the makers or to the local garage, but there will always be a great number who will do their own tinkering, and it is the latter who have my earnest sympathy.

An Opposed Twin Criticised.

The other day I had occasion to decarbonise the engine of a modern $3\frac{1}{2}$ h.p. flat twin, and in order to do this I was actually obliged to take the engine out of the frame. Nor was this all, for one of the tappet guides had to be removed before I could get at the cylinder holding-down bolt.

A suggested method of engine suspension, the small sketch showing the detachable side plate, the removal of which would enable the engine to be withdrawn from one side.

While I had the engine out I thought I would examine the big end bushes: These I discovered so cunningly concealed in the one-piece crank case that it was only with the utmost difficulty that I succeeded in taking them down and assembling them again. Now this engine is quite a pretty piece of work in all other respects, and I positively admire the outside key or dog type of drive to the magneto; it is of the high efficiency type and has a wonderful turn of speed, and has done everything asked of it during my ownership, yet it falls short in the vital matter of accessibility.

I do not wish a wrong construction to be placed on the meaning of these remarks, which, of course, do not apply to all flat twins, some of which are wonderfully

accessible, notably the Douglas, which has earned world fame for its all-round handiness. I merely wish to point out how excellent ideas can be spoilt by lack of care and thoughtfulness in design.

Detachable cylinder heads have always appealed to me as making for far greater accessibility than ever obtains in the majority of engines. Their success in the car world, notably on the Ford, has probably done more to popularise that particular machine than any other point of technical advantage.

In the motor cycle world the proved success of three notable examples—A.J.S., Blackburne, and Bradbury—should surely banish doubt and lead to a more widespread adoption by the makers of other famous machines.

Overhead Valves.

While talking of cylinders I frequently wonder why so many of the makers of overhead valve engines still make it necessary to remove the cylinder in order to take out a valve. With the detachable head again this trouble is done away with, but to those who are not blessed with this convenience it must always remain a problem why a detachable cage comprising valve and seating in one unit such as is fitted to the M.A.G., Rudge, and many aero engines is not more extensively used.

Why Not Flat Valve Springs.

Valve springs have always been fiendish things to fit without a proper tool, and are in the majority of cases without adjustment. Given the Lanchester type of flat leaf spring, it would be a simple matter not only to facilitate fitting, but also to introduce adjustability. However, the spiral spring is very neat and—when in position—unobtrusive, so I suppose it will stay, but while it stays it would certainly be a great convenience if all makers of machines using valve springs would provide a device such as is included in the tool kit of the Triumph—namely, a spring cage.

Frame design has undergone some changes, but remains essentially the same except in one or two cases. Even so, the removal of a modern 6 or 8 h.p. V twin

A method of using a flat spring for an overhead valve.

Accessibility.—

from the frame necessitates quite a lot of trouble that should not be necessary. It is surprising that the loop type of frame has not found greater favour. An application of the loop frame might easily be made to incorporate a cradle with a detachable side plate, thus enabling the engine to be drawn out from one side.

Quickly Detachable Wheels.

Countershaft gear boxes have done much to make things easier for those formerly afflicted with hub gears, at any rate when punctures occur. The knock-out type of spindle fitted to several chain-driven

machines makes for greater accessibility. There will probably be some one asking, "What about the expense?" and I must admit I have not considered cost of production in these remarks. However, true economy often looks expensive at first.

Still, we have heard so much of a cheaper production by firms specialising on one or perhaps two models that surely we may hope that the final plans laid down for their design will incorporate not only further points of refinement, but altogether eliminate the undesirable features of the pre-war era, and thus enable the British motor cycle to maintain its position as the world's leader.

DOUGLAS B. McQUEEN.

CLUBS AND TRIALS.

BY AN OLD COMPETITION RIDER.

ONCE again clubs and their secretaries are busy with their competition programmes, and many particulars have appeared in print of proposed open events. First and foremost I suppose is the proposed A.C.U. Six Days Reliability Trial, the date for which is September 15th to 20th. It is to be regretted that so far we see no announcement of breaking away from the old "groove" of the "out and home" reliability trial; surely the motor cycle, from a test point of view, is past this stage and deserves something more "brainy" and intellectual.

I would ask clubs whether they consider that manufacturers will continue to support these trials unless new ideas are incorporated which will cause public interest in their machines and at the same time be instructive to public and manufacturer alike?

To make a reliability trial simply a test between "watches" is simply farcical. Could anything be more unfair to the manufacturer than to determine the best machine by the seconds hand of a watch?

A Suggestion.

Trials with non-stop sections, freak hills, and bad road surface conditions are equally unfair, as they resolve themselves very often into physical tests, and the elements of luck and strength of rider have far too great a prominence.

The field is a very large one for instructive trials. A few which come to my mind at present are:

- (1.) Hill-climbing with flexibility tests.
- (2.) Acceleration tests.
- (3.) Traffic driving tests.
- (4.) Accessibility.
- (5.) Mudguarding.
- (6.) Lamp, tyre, and non-skid tests.
- (7.) Fuel tests.

Also, why not a test for one-lever carburettors? These would instruct and interest the rider and manufacturer alike.

I have before me at the moment particulars of a trial, which was carried out by the Streatham and District Motor Cycle Club in November, 1913, called an "Open Touring Trial," which included tests in reliability, speed, acceleration, and stopping and starting on a hill, and the 'judges' report and published results were a mine of information and one of the most interesting documents issued by a club which I have ever read. That trial, in my opinion, was a step in the right direction, but even that is not finality in

what might be done in trials of an instructive and interesting nature.

Individual A.C.U. Trials.

There is a type of trial I should like to see carried out in greater numbers than heretofore, and that is the "individual" trial under the rules and observation of the A.C.U., which admits personal observation throughout the trial, and the A.C.U. might make more generally known their willingness to observe these trials.

Unless we can obviate the overlapping and similarity of trials, I am afraid manufacturers will begin seriously to think of the cost; therefore let us devise means to prevent this eventuality.

I think we realise and recognise that much gratitude is due to manufacturers for their past support of our trials and the generous manner in which they have contributed, in many instances, to our prize lists.

Let us prove to them that we are really alive to their interests, and then I am sure they will not fail us.

My final word is, do not ask too much of them this year, but let us concentrate our energies and brains in devising means and ways to interest them in our trials and competitions, to our own and their benefit for future years.

An ex-P. and M. rider, W. Pratt, who was badly wounded eighteen months ago, astride our photographer's Matchless. Pratt still has to use crutches, and it is highly improbable that he will appear in competition this year.

RECENT PATENTS.

REVIEWED BY B. H. DAVIES.

OF the making of spring forks there is no end, but the Royal Ruby latest, in one of its applications, looks rather nice. As the illustration shows, it consists of a modification of the Druid type, in which the fork is hinged to the steering head by two pairs of side links. Under the Ruby patent a third link is

Rigby's spring fork. No. 123,859. 26/3/18.

placed between the lower pair and is utilised as the cantilever of a spring, preferably of the laminated pattern. This leaf spring may either lie in the line of the fork (which makes a very neat job) or be approximately horizontal. Mr. Rigby states in his claim that the side links of the ordinary four-link fork often break, and that the additional link enables the machine to be ridden home after such contretemps. I have not personally struck a broken side link.

Compound Handle-bar Control.

Mr. Fisker, of Copenhagen, has protected a compound type of handle-bar control, embodying the usual inverted lever and a special form of twisting grip.

Fisker's handle-bar control No. 123,901. 21/5/18.

The end of a Bowden wire is secured to a tiny lever pivoted on a lug formed on a sleeve fixed in the end of the bar. The twisting grip contains a sleeve, the outer end of which is extended to form a cam; as the grip is twisted, the cam operates the lever and tightens or relaxes the wire. By a suitable arrangement of cams two wires can be operated by one twisting grip. The combination is quite neat, but the leverage and range of movement afforded are not excessive.

A Simple Carburetter.

Messrs. Kemp and Spurway have evolved a simple carburetter which is fundamentally of the two-lever type, but can be adjusted to a fair degree of automaticity. It is of the vertical type with a side gas outlet to the engine controlled by a piston throttle, and its main interest lies in the air control. The air intake is situated on one side of the base of the jet chamber; the air control piston is machined out internally to form the choke tube, and surrounds the jet. The entire air supply thus passes up round the jet. The choke tube is coupled by a side-stalk, bridge piece, and Bowden wire to the second lever on the handle-bar. As the lever is "opened," the strength of the depression and the point of maximum depression in the spraying chamber are both varied. Very strong suction is obtained for starting purposes with the choke tube in its lowest position, and by suitable contouring of the choke passage any desired correction for high speeds

Kemp and Spurway's carburetter. No. 121,572. 19/7/18.

can be obtained. At the same time provision is made for the choke tube to rise and fall automatically in response to engine suction. The choke tube is made very light, and would naturally respond to engine suction unless the coiled spring surrounding its control wire were stiff enough to repress it. As the choke tube is light, a light spring can be used; and the tension of this spring can be adjusted from outside the carburetter by a milled-headed sleeve.

Valve Operating Mechanism.

The James Co. have produced a neat mechanism for operating side valves in a single or twin. They state in their claim that on the ordinary side valve engine, the valves are mounted in the same plane, but the cams in two different planes, so that cranked tappet levers are often necessary, and bent levers are expensive to make and liable to fracture. As the

sketch shows, their device overcomes all these snags: but its main value may be that it sets the exhaust valve further out than the inlet valve, and simplifies the task of dissipating the exhaust heat into the atmosphere, instead of conducting it back into the cylinder head, where it is usually answerable for a hot spot and consequent distortion.

The James valve mechanism. No. 123,800. 28/2/18.

Sparking Plug with Adjustable Gap.

Messrs. Kent and Martin have devised a sparking plug with two features of interest. In the first place, the central electrode screws up and down in a threaded bush, inserted down the centre of the electrode. A marked disc and pointer below the milled head of the electrode show what size of gap is in operation, as the central electrode is screwed towards, or away from, the fixed sparking point. Secondly, the metal body of the plug is perforated to admit cooling air to an annular recess surrounding the insulator. Such a plug will make good if or when it is as well insulated as a non-adjustable type, and proves as compression-tight in prolonged use. I have tested several such patents on the road. In most cases the insulator began to leak or the charge to "blow," or the adjustment to jam, before I had made up my mind whether the adjustable gap was of much practical use. In the plug under notice, there are obvious possibilities of variable expansion, of gas leaks up the thread of the electrode, followed by carbon jamming the threads. Nothing short of actual test can determine its value. The inventors have presumably verified these points before sinking money on their notion.

Kent's sparking plug. Pat. No. 122,865. 2/1/18.

A HETERODOX RUNABOUT.

A Newcomer with Several Novel Features to be Marketed by a Large Engineering Firm in the Midlands.

JUST as, a few years ago, it was hard to draw the lines of demarcation between the cycle car and the light car, and the latter and its larger sister, it is almost as difficult to-day to define some of the new designs which are about to be introduced to the public.

It is an open question whether the local taxation authorities will consider a "three-wheeler" with twin rear wheel a four-wheeler or not, but if these twin wheels are built up as one, probably such a machine could, with justice, be claimed to be a three-wheeler.

On the other hand, a vehicle having two separate rear wheels placed close together is so near being both a three and a four-wheeler, it is hard to designate its type.

The Ashton-Evens runabout, having rear wheels eight inches apart, giving the appearance of a three-wheeler.

The Ashton-Evens design, which we illustrate on this page, is in this category, but since its proposed price is in the neighbourhood of many of the new three-wheelers which will shortly be on the market, and also because motor cycle practice exists at certain points, it will interest those of our readers to whom the three-wheeler appeals.

Two Rear Wheels Eight Inches Apart.

Two rear wheels, 8in. apart, form a noticeable feature of the design. The wheels are supported on short axles, and, therefore, practically as accessible as any wheel on a four-wheeler.

A central cardan-shaft drive is carried to a bevel between the two wheels, three

speeds and reverse being provided by a car type gear box of extremely neat design. Also between the rear wheels is carried the single quarter elliptic leaf spring which constitutes the rear springing.

The frame is of tubular construction of trussed design, and a motor cycle type V twin engine is being considered as the power unit, but more probably a four-cylinder water-cooled may be decided upon.

With a wheelbase of 8ft., and an engine developing 15 h.p., the weight is under 12 cwt. The price has not yet been decided, but Ashton-Evens Motors, Ltd., hope to be able to market the car at a figure in the neighbourhood of £200.

The arrangement of rear framework and transmission.

THE FALLOLITE LAMP.

A Successful Adaptation of the "Limelight" Principle to Motor Cycle Requirements.

IT is more than five years ago that we dealt with the Fallolite lamp in *The Motor Cycle*. It was just beginning to attain a certain amount of popularity among motor cyclists when the war broke out, and the production of Fallolite lamps for private uses ceased.

In the lamp under consideration there are two distinct departures from standard practice. The first of these is in the design of the burner, which practically amounts to an incandescent burner adapted to the use of acetylene gas; and

by the use of a dissolved acetylene cylinder.

The burner is of the Bunsen variety, and admits a tiny jet of gas together with a large proportion of air through the nozzle. At the base of the nozzle is fixed a small holder for the purpose of carrying the wire on which the pastille, composed of rare earths, is fixed. Almost immediately after lighting the lamp the pastille becomes incandescent, and a very powerful light is given off. This burner, the makers claim, is eight times more efficient than an ordinary burner. There is no doubt that it gives a better light and is more economical than the ordinary type, as its consumption is one-third of that of the usual acetylene lamp. Moreover, the light is perfectly steady.

An Adjustable Beam.

The Fallolite lamp has another advantage: there is absolutely no glare unless one directly faces the lamp, as the back of the pastille is quite "dead." Since the burner slides through the centre of the mirror, the focus can be conveniently adjusted so as to give either a narrow beam, penetrating far ahead, or a wide beam. It is also claimed that the colour of the light is such that it enables objects to stand out in their natural

colours—a fact which renders the Fallolite very effective in penetrating fog.

The latest type of Fallolite generator is an ingenious and well constructed article. The gas supply is absolutely automatic, and, once full, the generator can be lit or relit without waste until the carbide is completely exhausted. When out of use the generator is perfectly gas-tight, and from the time the flame is extinguished there is no smell.

The lamp and generator are made by Fallolite, Ltd., 27, Noel Street, London, W.1.

The generator used with the Fallolite lamps.

CHEAPER MOTOR FUEL.

The next of the series of public meetings being held by the Automobile Association in connection with its motor fuel campaign will be held to-day at York in the Assembly Rooms, at 3 p.m. Local motorists are strongly urged to attend.

The Fallolite motor cycle head lamp.

the second is in the design of the generator, in which considerable ingenuity is displayed. Of course, it is not necessary to use a container at all, but gas must be supplied to the burner under slight pressure, and this can be obtained

CURRENT CHAT

Times to Light Lamps.

SUMMER TIME.

June 12th	9.47 p.m.
" 14th	9.49 "
" 16th	9.50 "
" 18th	9.52 "

Dangerous.

Our attention has been called to the very dangerous condition of the canal bridge at Sankey Bridges, Warrington.

Ariel Prices Up.

Owing to the continued advances in cost of production the Ariel Co. advise us that on and after the 11th inst. their prices for Ariel motor cycles will be advanced to £90 for the 3½ h.p. counter-shaft model, £105 for the 6-7 h.p., and £30 for the sidecar.

Passenger Machine Trial.

The Birmingham Motor Cycle Club is making arrangements to hold an open trial on July 19th for passenger machines only.

The course will be in the Midlands, but over entirely new ground. The awards will be as follows: Premier award, the Midland cup; first awards, gold medals; second awards, silver medals.

The entry fees will be £1 1s. for non-members, and 10s. 6d. for members. Further particulars will be issued later. Application for membership should be made at once to the hon. sec., Mr. W. H. Egginton, 76, Earlsbury Gardens, Birchfield, Birmingham.

The Bristol Rally.

As announced in last week's issue of *The Motor Cycle*, the Bristol Motor Cycle Club, at the request of the Auto Cycle Union, are organising a West of England rally for individual members of the Union, or members of affiliated clubs, for Saturday, the 21st inst. The General Committee of the A.C.U. meet at the Grand Hotel, Bristol, on the day previous, and it is intended to commemorate their visit by a big Bristol motor cycle meet, the organisation of which is in the capable hands of Messrs. S. L. Bailey, Tozer, and Cates, of the Bristol M.C.C.

The programme up to the present is by no means complete, but a very interesting afternoon is promised to those who can find time to make the journey. Already one of the finest bands in Bristol has been engaged, and Lady Smyth has kindly loaned the beautiful grounds of Ashton Court for the picnic.

The grounds are a haven of beauty, away from the hustle and bustle of the busy city of Bristol. The route, which will be arrowed for the convenience of visitors, abounds in magnificent views, from densely wooded promenades to abrupt chasms of colour—deep ravines of shrubbery, bordering the banks of the Avon, winding like a huge brown serpent 300ft. below. Apart from its magnificent scenery, there is much more to commend the route, as many spots and landmarks within handy distance are of more than passing interest. A brief historical review will be included in the souvenir programme, which is being prepared.

Special Features.

HOW I TOOK UP MOTOR CYCLING.

ACCESSIBILITY.

LONDON-EDINBURGH RUN.

Amongst the sports items will be events for ladies as well as gentlemen, full particulars of which will be announced later.

Bristol riders evidently mean royally to welcome motor cyclists to their city, and those who take advantage of the invitation are assured a pleasant and interesting time. Members of the A.C.U. who have not yet visited the West of England will find the trip quite worth while.

THE MOTOR CYCLE

SUMMER NUMBER NEXT THURSDAY,

Will contain many SPECIAL ARTICLES of interest to all motor cyclists, including

WHERE TO GO FOR THE SUMMER TOUR

Written by motor cyclists familiar with the districts they describe.

A REVIEW OF DESIGN IN 1919.

THE FAMILY SIDECAR.

The most popular vehicle on the road, and why.

THE YOUTHFUL MOTOR CYCLIST.

Why the motor cycle appeals to the young man.

NO AGE LIMIT.

The motor cycle as a suitable mount for the man of mature years.

The usual popular features of "The Motor Cycle" will be retained.

King's Birthday Honours.

Hearty congratulations to Capt. C. T. Newsome, R.A.S.C., on being awarded the O.B.E. (Military Division). Before the war, Capt. Newsome was a Rover exponent in trials and T.T. Races. Other motor cyclists mentioned on the list published on the King's Birthday are Motor Cyclist Cpl. G. Halliday, 3rd Division, Signal Company, R.E., who has been awarded the Distinguished Conduct Medal; Capt. A. J. O. Henrey, and Lt. W. J. Houghton, who have received the M.B.E. (Military Division), both of the South African Motor Cyclists' Corps. Maj. A. J. Palmer, late assistant cashier of *The Motor Cycle*, and who joined the Motor Machine Gun Corps through *The Motor Cycle*, has also been awarded the O.B.E.

The organisers of the Bristol Rally on the 21st inst. Seated in the Morgan is Mr. Cates, on the carrier of the machine Mr. S. L. Bailey, and in the sidecar Mr. Smith, the secretary of the Bristol club. The solo rider is Mr. Tozer.

Next Week!

The Motor Cycle Summer Number, which will be an enlarged issue.

Brooklands.

In conversation with Col. Lindsay Lloyd last week, we were assured that there was no possibility of Brooklands race meetings being organised this year owing to the state of the track.

Police take to Motoring.

A reader advises us that on the Manchester-Chester road the police recently used a Ford car to chase a motor cyclist, whom they considered was exceeding the speed limit. We wonder whether the Ford won the race, and, if so, whether the policemen were not liable to be prosecuted for exceeding the speed of their victim.

A £100 Cycle Car!

We have heard of a new cycle car which is to be placed on the market in the autumn of the present year. The specification includes 8 h.p. V twin engine (water-cooled), stamped sheet metal two-seated torpedo body, bucket seats, four disc wheels, shaft transmission, and three-speed and reverse gear box. The car is said to be entirely British built, and is to be produced in quantities with every part catalogued and interchangeable, and will be ready by autumn. The proposed price is £100, but £80 is mentioned as the ultimate figure when production is in full swing.

The Birmingham-Land's End Trial.

Fifty entrants started in brilliant weather for the Birmingham M.C.C. Trial to Land's End last Saturday. The roads were good as far as Minehead, where there was a time check, after which the competitors had to climb the notorious Porlock Hill on the way to Lynmouth. The route then included Lynton Hill, and continued *via* Loxhore and Barnstaple to Penzance. Many failures among the lightweights were attributed to the bad state of the roads, which were in great contrast to the first part of the journey.

Among those who made good ascents of Porlock were Kickham (Sunbeam), Baker (B.S.A.), Stevens (James), Newey (Ariel), and Kuhn (Levis).

Duke (Triumph) was the first competitor to reach Penzance, Baker following.

The following completed the outward journey: R. W. Duke (4 h.p. Triumph), G. A. Dalby (4 h.p. Triumph), G. A. Dingle (Triumph), H. Poole (A.J.S.), H. C. Heath (2½ h.p. A.J.S.), H. B. Dealey (Morgan), F. W. Giles (6 h.p. A.J.S.), T. Stevens (4½ h.p. James sc.), L. Clark (5.6 h.p. James sc.), J. C. Greenwood (8 h.p. Sunbeam), E. W. Choldercroft (4 h.p. A.J.S.), — Baynton (5.6 h.p. James), E. Kipbee (4 h.p. Triumph), L. Devey (4½ h.p. Ariel sc.), H. D. Meade (2½ h.p. N.U.T.), T. Pollock (5.6 h.p. James sc.), F. J. Watson (3½ h.p. Ariel sc.), E. Kickham (3½ h.p. Sunbeam), C. Harkwright (2½ h.p. New Imperial), A. H. Johnson (2½ h.p. Allon), G. Kuhn (2½ h.p. Levis), H. R. Fowler (5.6 h.p. James), H. P. Cutler (4 h.p. Norton sc.), and R. W. Vaughan (5.6 h.p. James sc.).

Mr. T. Silver checked the competitors in at Penzance and restarted them on the return journey at 4 a.m. last Tuesday.

Name and Address Wanted.

The Editor will be pleased if "Interested" will communicate with him, sending name and address. Correspondence will be treated with strictest confidence.

Motor Legislation.

The Automobile Association includes in its membership a very large proportion of the members of both Houses of Parliament. In connection with its opposition to the Transport Bill, and its campaign for the reapplication of the revenue from motor taxation to road maintenance and improvement, the support of these members has been asked for.

Scandinavian Markets.

American motor cycle manufacturers are not wasting much time in getting on to a peace footing. Representatives are active in Sweden and Denmark already, and establishing central sales organisations, and have altered their pre-war policy by offering credits. The importation of cars is already very heavy, and apparently the position will soon be the same with regard to motor cycles.

The Moto-Cycle Club de Lyon.

We have had a communication from M. Bothier, secretary of the Moto-Cycle Club de Lyon, Place des Terreaux, Lyons, in which he offers assistance to English motor cyclists passing through that town by giving them information as to how to traverse the town, and all help possible. Lyons is a town which has been closely connected by trade with England for many generations, and its inhabitants are exceedingly amicably disposed towards everybody and everything British.

Touring in Ireland.

We understand from the R.A.C. that a member who has recently undertaken a tour in the South of Ireland reports very favourably on his experiences there. He found the hotel and garage accommodation quite good, while the roads generally were in fair condition. The tourist frequently took his meals by the roadside, and he commends the hospitality of the people in supplying hot water and other necessities. This motorist's experience provides a happy contradiction to the somewhat prevalent fear that Ireland is not an inviting land for the motor tourist just now.

Thief-proof Devices.

The Autocar last week gave illustrations and particulars of upwards of a dozen thief-foiling devices for attachment to cars. Many of these could be adapted for use on a motor cycle, and we invite readers to send suggestions regarding such fittings.

Australia and the U.S.A.

Recent sporting events held in U.S.A. reveal the overwhelming proportions of American made machines compared with those of other countries. This is not as it should be, though it must be said, in fairness to the British representative makes, that they generally make a good showing against the often higher-powered Yankees. The actual proportion of British machines to American in the three or four most recent trials amounts to something less than four per cent.

An Amalgamation in Belgium.

An amalgamation has just been made between the Royal Automobile Club of Belgium and the Belgian Motor Cycling Club. Members of the Royal Automobile Association of Belgium become members of the R.A.C.B., the president of the Association becomes vice-president of the R.A.C.B., members of its council are admitted to the councils of the R.A.C.B., and vice-presidents of committees of the R.A.A.B. become vice-presidents of committees of the R.A.C.B.

Electricity and the Motor Cyclist.

But few motor cyclists have more than a very elementary knowledge of electricity, both as regards its application to ignition and to lighting, and, although written primarily for the car owner, "Electricity and the Motor Car," by F. H. Hutton, will not fail to interest and be of immense use to the motor cyclist who wishes to know more about the subject. This book is published by the proprietors of *The Motor Cycle*, and contains, among others, lengthy chapters on first principles, their direct application, accumulators, ignition, dynamo-battery ignition, and modern magnetos, all of which are as useful to the motor cyclist as to the car owner. The price of the book is 4s. 6d. net. or by post 4s. 10d., and may be obtained from leading booksellers, or from Messrs. Iliffe and Sons Ltd., 20, Tudor Street, London, E.C.4.

A 2½ h.p. Coventry Challenge fitted with an experimental spring frame of a new type.

142 motor cyclist competitors start. 126 finish (equalling 88.7% successes), 63 being mounted on solo machines, and 63 on passenger motor cycles.

wheels belonging to spectators. The A.B.C. scooter "scooted" through the crowd and caused great amusement.

Reunion of Motor Cyclists.

It was a happy reunion of many old friends, for the entrants had come from all quarters—including Ireland—to compete in the classic event. The Services were well represented. There were upwards of forty makes, of which a dozen were new models which very few had seen. Most of these Peace models are in every way worthy of the British motor cycle industry, and nothing but good can come of their being displayed before a patiently waiting public.

The Clynos now have red and black tanks, and look particularly smart.

Mr. H. F. S. Morgan's runabout attracted everyone's attention by its white finish and black guards, etc. The new spring frame Matchless and Chater-Lea are a light buff. The latter machine employs a single leaf spring, which constitutes a very neat suspension.

As the hour of nine approached, the crowd became denser, and when the first of the competitors—Sec.-Lt. W. Cooper (Douglas)—was sent away by Mr. A. V. Ebbelwhite, there was only a narrow lane

extending for half a mile between two deep rows of spectators.

For the first time, the trial started in daylight, thanks to summer time, but, by the time the first of the sidecars started, it was time to light up, in which connection it was quite noticeable the

(Left) Showing how the oil is led into transfer port cover of the 1919 2 1/2 h.p. two-stroke Clyno.

number of machines which were equipped with electric light. Several of the machines were fitted with the latest Lucas combined lighting and ignition unit. We counted over twenty lady passengers.

J. D. Campbell and his passenger, New Zealand motor cyclists, on an A.J.S.

the Blackburnes, Rex, and A.J.S. also had their group of admirers.

The interest of between 5,000 and 10,000 spectators was not idle curiosity, as every other person seemed to have in his hands a copy of either *The Motor Cycle* or the official programme. Even the police were interested, and were seen studying the machines with *The Motor Cycle* as a guide, and it was clear that their interest was in no way connected with their activities in measuring the lenses of the lamps. Quite a large squad of police were on the spot, including mounted men to help to keep a clear path for the competitors to pass through.

In addition to the competing machines, there were motor cycles of every description, and bicycles propelled by Auto-

Scene at the start from Highgate on Friday evening last. The crowd was immense, and almost completely hid the new machines from view.

The start—for the first time in daylight. Sec.-Lt. Cooper (No. 1), the organiser of the run, and Major L. A. Baddeley, awaiting the starter's signal.

THE RUN DESCRIBED BY A COMPETITOR.

Once more *en route* for Edinburgh after five years' interval! There seemed to be the same bustle and the same familiar faces. But we missed that searchlight at the start, the darkness overhead, and the hundreds of lamps. Now we comfortably glide away in broad daylight, and the night journey somehow seems shorn of its terrors.

Our immediate companions were old stagers, purposely placed in front to lead the way. W. Cooper, the trials hon. sec., was number one, and for half the journey escaped the dust, a 2½ h.p. Douglas carrying him on his important mission. L. A. Baddeley, also on a Douglas, one of the travelling marshals, was number two, and then followed Olsson (4 h.p. Douglas). Our old friend A. J. Sproston, now home from Egypt, and back in civilian life, was on a Lea-Francis, Moffat on one of the new 3½ h.p. Douglasses, A. C. Rob-

bins on a new Wooler, Hemy on a Metro, and Scott on a 5-6 h.p. James. It was a perfect evening.

The vanguard stopped quite reluctantly outside Hatfield to light lamps. It seemed a shame not to go on until the last glimmer faded from the summer sky. Here we met a small naval contingent, foregathered to cheer their ship-mate, Lt. Kidston, R.N., who, after his ship was torpedoed early in the war, served in H.M.S. *Orion* under the late Sir Robert Arbuthnot, who told him of the joys of the London-Edinburgh run. Near Welwyn we saw the first victim of the many tyre troubles.

The roads being good, naturally it was the easiest thing in the world to be ahead of time: consequently there were several waiting outside Baldock. Here Nicholson (Sunbeam) reported two punctures already. Another early sufferer was Robertson Brown (Henderson), who was knocked over by a non-com-

petitor near Potters Bar, had his carrier broken, and for the rest of the long journey had to carry a heavy bag slung over his back.

Impressions of the Night Trip.

It had been very hot at the start, but, once started, it was comfortably cool; so much so that we feared that De Arango, the Brazilian naval lieutenant, who wore only a drill suit and no overalls, would feel chilled to the bone, but he appeared happy, nevertheless, on his Harley-Davidson.

Lt. J. A. W. Armstrong (3½ h.p. Lea-Francis).

The surface was fairly good, but it threatened to become dusty at Biggleswade, the first check. Here the arrangements were excellent. Petrol and necessities for the machines were promptly served out, and the proprietors of the Swan Hotel had a splendid spread for the competitors. It was not really dark till this place was reached, and when we left the sidecars were arriving. Some of the competitors used wonderfully power-

At every point the interest of the public in the new mounts was shown by the crowds around them. (Left) A group about Emerson's A.B.C. sidecar. (Right) Hugh Gibson's new Clyno is admired at York.

The London-Edinburgh Run.—

ful head lights, causing a weird effect on those who were not so well equipped. We were using a quite effective and well-trusted small Lucas head light, but some of the electric projectors threw so brilliant a beam that the shadow of the rider ahead danced in front of him nearly all the time, thrown on the road, against the trees, or, worst of all, against a cloud of dust.

After the last stop the one or two dangerous corners were well marked, and all was plain sailing till we reached the district round Alconbury, when there were several miles of rather bad road, which was struck unexpectedly. We had been warned of a rough stretch near Stamford, and close to where it began we came across two policemen, whose advice we followed, and by keeping close to the side of the road we were considerably less inconvenienced than most. Hereabouts G. A. Read (Coulson) lost his tool kit, and was later reported to have crashed and had to retire.

An Automatic Tail Light.

On the way to Grantham we saw something of the Scootamota, which was being ridden by a non-competitor. To this point it travelled well, but having lost the silencer, blue flame shot out behind.

This was the first Edinburgh run in which tail lamps were compulsory, and the effect of the long string of these during the night was very strange, but not all of them, unfortunately, kept alight. It had been a wonderfully fine night run, and an equally fine day followed.

Here stories were exchanged of experiences of the night trip. At Buckden some thoughtful people with a car provided free tea for those requiring it, which was much appreciated. Later some stray horses were encountered, which were said to have driven at least one competitor into the ditch.

The roads were good on the whole to Doncaster, but excessively bad from Ferrybridge to York, where again the arrangements were splendid. The most

At the York check, which was in the hands of the Rev. H. T. S. Gedge, who is shown taking the times of K. V. Chidley (flat twin Wooker) and G. F. Ammon (2 1/2 Metro-Tyler).

(Left) The cover of the timing gear case of the 5 h.p. Brough flat twin is extended to form a manifold.

(Right) An aluminium air deflector fitted between the tank and the cylinder head on Mr. Pike's 2 1/2 h.p. Levis.

interesting part of the morning journey was from Scotch Corner to Penrith, through glorious country under an Italian sky, but, unfortunately, the dust! Several competitors continually rode in inseparable groups.

Troubles en Route.

D. S. Baddeley (P. and M.) had contact breaker trouble near Brough, whilst Douglass (Harley-Davidson sc.) was in collision and buckled both wheels and retired. W. Cooper (Douglas), who had had electrical trouble, passed at a rare "bat" near Penrith, his troubles over for the day. Luigi (B.S.A.) had punctures in this section. News also reached us that the fine old sportsman Dover (Douglas sc.) had to withdraw owing to eye trouble due to defective goggles.

After luncheon at Carlisle the sky became overcast, and a violent south-west gale sprang up.

The climb to Mossbail summit (800ft.) caused no trouble. Many rested at the inn at the top for tea. Here the weather was glorious again and the conditions excellent. Later our only trouble with the A.B.C. occurred, an exhaust rocker sticking, owing to dust. It caused a little delay, but, once put right, the machine ran beautifully, and finished to time. Hawick, the next and last check before Edinburgh, was enjoying a holiday, and the streets were thronged with people.

Later in the afternoon rain fell heavily, and the journey, almost to the finish, was by no means comfortable. Happily it was fine again before Liberton was reached, and, except for this final down-pour, the weather had been glorious. Naturally, the number of successes was considerable. But ill-fortune overtook a number among these, other than those previously mentioned, being Frank Smith, who, owing to gear box trouble, retired at Doncaster. Another of the new models which failed to finish was the flat twin Wooker (ridden by A. C. Robbins) which developed engine trouble near York. The sister machine (ridden by Chidley) finished successfully. Nias (Rudge) was reported

R. C. Davis (8 h.p. spring-frame Chater-Lea sidecar), one of the first of the sidecars to start with lighted lamps.

(1) Entering York. (2) Nearing the finish. Competitors going well after eighteen hours riding.

to have retired after an accident, while Harrison (Norton) had his magneto break down before reaching Grantham. Cleese (Norton sc.) suffered with tank trouble early in the run, and failed to finish.

As regards the seven cycle cars entered, the Morgans, of which there were five, ran exceedingly well, especially that driven by H. F. S. Morgan. Nash's G.N. also ran most consistently, and was

NOTES ON THE TRIAL.

Altogether the run was one of the most successful the Club has ever held, and the organisers deserve the greatest credit.

George Wray rode a 1909 Triumph he bought for £14, which he fitted with a gear of his own design.

The inseparable Jacobs and Le Grand could not compete, as their new Rex mounts could not be completed in time.

Mr. Duncan-Watson at the start thoughtfully presented each Harley-Davidson driver with a box of cigarettes and matches.

Major Baddeley (Douglas) came through successfully on tyres six years old.

Emerson's A.B.C. outfit was only finished at the last moment. The engine had not even fired before ten o'clock on the morning of the trial.

The Blackburne firm was fortunate enough to get all their new models through, and to finish successfully.

Great interest was evinced in the run throughout. Even in the country groups collected at cross roads and on the few hills on the route to observe the long procession of competitors.

delayed only by a puncture near Carlisle. The Duncan, a belt-driven cycle car, fell behind during the night, and was last seen near Wentbridge.

Below we give a list of those who completed the journey; as to who gained medals, nothing can be said till all the checkers' sheets have been verified.

Competitors had to cover the journey in twenty-three hours to obtain a gold medal, and twenty-four hours and thirty hours for silver and bronze medals respectively.

The 1919 model all-black A.J.S. sidcars ran like clockwork throughout.

Most of the non-starters were prevented from competing from the all-too prevalent delay in delivery of new models.

An amusing notice near a dangerous corner on the route read "Sound your horn," and in small letters underneath, "and save your neck."

Mr. W. H. Wells led the procession aboard his 25 h.p. Overland—the first official car. Lt.-Col. Chas. Jarrott was at the helm of the second official car—a white 25-30 h.p. Crossley.

**Oldham and District M.C.**

Entries close on Friday, the 20th, at 7 p.m., for the Oldham and District M.C. hill-climb at Booth Dene on the 21st. Hon. sec., Mr. H. Wright, 134, Manchester Street, Oldham.

York and District M.C.C.

The interest of Yeovil motor cyclists in the local club augurs well for its future. A strong committee has been formed consisting of Messrs. P. W. Moffatt, F. E. Butt, F. Mason, Courtney Williams, E. Arnold Wright, V. Tucker, R. Field, A. Ewens, W. J. Edwards, E. Chaffey, E. Woodman, Mrs. Charleston, and Mrs. Lukin. The secretary is Mr. Joseph Ewing, jun., 17, Wyndham Street, Yeovil.

Edinburgh and District M.C.

A sporting open one-day reliability trial will be held by the Edinburgh and District M.C. on Saturday, the 14th, open to all classes of motor cycles and cars. The trial starts at 1.30 p.m. on the Liberton tramcar terminus. The course, eighty miles, is a secret one, and certain hills will be observed, up all of which a clean ascent must be made. There will be a stop of 1½ hours for tea, during which no repairs or adjustments may be made. The organisers are Messrs. F. J. Hutchisson and H. McClae, 6, Castle Terrace, Edinburgh.

The Junior Car Club.

The Junior Car Club will hold a hill-climb on South Harting Hill, open to members only, on the 21st. Class 1 will be open to standard three-wheeled cycle cars with engines not exceeding 1,100 c.c. carrying a passenger. Awards will be made on time and formula according to the number of entries received. The formula has been devised by Maj. A. M.

W
Low, and is $\frac{W}{C1.1 \times T1.3}$. The trials hon. secretary is Mr. G. N. Higgs, 31, Vauxhall, Bridge Road, London, S.W.1.

Harrogate and District M.C.C. Trial.

The Harrogate Club was blessed with a most glorious day for its reliability trial held on June 1st, but it was a pity the members were not also blessed with delivery of new models, for then the entry would have been considerably larger. The course picked out was about 100 miles in length, and included such hills as Middlesmoor Hill, Greenhow, Church Bank, and Leathley Bank (all included in non-stop sections). It was, however, sufficiently arduous to eliminate quite a number of machines.

Except for the three riders who tied for the awards, most of the remaining competitors experienced puncture troubles. The results are as follow:

1. W. B. Atkinson (4 Triumph).
2. W. E. Grange (3½ P. and M.)
3. D. Moore (3½ P. and M.)

Future Events.

June 14.—M.C.U. of Ireland, Ulster Centre. Speed Trials at Magilligan.
 June 14.—Sheffield and Hallamshire M.C.C. Run to Cowdale.
 JUNE 14.—WESTERN M.C.C. (GLASGOW). OPEN HILL-CLIMB.
 June 14.—Wolverhampton M.C.C. Run to Wellington Wrekin.
 JUNE 14.—YEovil AND DISTRICT M.C.C. RELIABILITY TRIAL.
 June 15.—Eastern Counties M.C. Run to Little Waltham.
 June 15.—Essex M.C. Run to Southend.
 June 15.—Middlesbrough and District M.C.C. Picnic on Whitby Moor.
 June 15.—N.M.C.F.U., Birmingham and Coventry Branches. Joint Hill-climb at Broadway.
 June 15.—N.M.C.F.U., Leeds. Run to Doncaster.
 June 15.—N.M.C.F.U., Portsmouth. Picnic Run to Waggoner's Wells.
 June 15.—North Derbyshire M.C.C. Run to Ashbourne.
 June 15.—Rochester, Chatham, and District M.C. Run to Rye.
 June 15.—S. Birmingham M.C.C. Run to Knightwick.
 June 15.—Worcester and District M.C.C. Opening Run to Stratford-on-Avon.
 June 15.—Yeovil and District M.C.C. Run to Longcat.
 JUNE 15.—MIDDLESBROUGH AND DISTRICT M.C.C. RELIABILITY TRIAL FOR CRADY CUP.
 June 18.—Westmorland M.C.C. Social Run to Windermere, etc.
 June 18.—Yeovil and District M.C.C. "Treasure Hunt."
 June 19.—N.M.C.F.U., Leeds. Half-yearly General Meeting.
 JUNE 20.—A.C.U. COMMITTEE MEETING AT BRISTOL.
 June 20-21.—Sheffield and Hallamshire M.C.C. Reliability Trial to Holyhead for Hulton Shield.
 JUNE 21.—BRISTOL M.C.C. RALLY AT ASHTON COURT.
 JUNE 21.—JUNIOR CAR CLUB. HILL-CLIMB AT SOUTH HARTING.
 JUNE 21.—MIDDLESBROUGH AND DISTRICT M.C.C. SPEED JUDGING COMPETITION.
 JUNE 21.—OLDHAM AND DISTRICT M.C. HILL-CLIMB. BOOTH DENE.
 June 21.—Public Schools M.C.C. Surprise Competition.
 JUNE 26.—YEovil AND DISTRICT M.C.C. AND TACENTON M.C.C. INTER-CLUB HILL-CLIMB.
 JUNE 28.—BIRMINGHAM M.C.C. SPEED TRIALS.
 JUNE 28.—LIVERPOOL M.C. TWENTY-FOUR HOUR TRIAL TO EDINBURGH.
 JUNE 28.—M.C.U. OF IRELAND, ULSTER CENTRE. RELIABILITY RUN.
 JUNE 28.—MIDLAND C. AND A.C. RELIABILITY TRIAL.
 JULY 4 AND 5.—ARBUTHNOT TROPHY TWO DAYS TRIAL. PLYMOUTH DISTRICT.
 July 5.—M.C.C. Hill-climb.
 JULY 6.—OLDHAM AND DISTRICT M.C. RELIABILITY TRIAL.
 JULY 12.—LIVERPOOL M.C. RACES AT COLWYNN BRYCHEL.
 JULY 12.—WOLVERHAMPTON M.C.C. OPEN TRIAL.
 JULY 14-15.—M.C.U. OF IRELAND, ULSTER CENTRE. IRISH END-TO-END RELIABILITY RUN.
 JULY 16.—ESSEX MOTOR CLUB SPEED TRIALS AT SOUTHEND.
 JULY 19.—BIRMINGHAM M.C.C. MIDLAND CUP TRIAL.
 JULY.—MIDDLESBROUGH AND DISTRICT M.C.C. 200 MILES RELIABILITY TRIAL FOR GJERS AND NEW HUDSON CUPS.
 AUG. 16.—S.E. COUNTIES INTER-TEAM TRIAL.
 SEPT. 3.—M.C.C. TEAM TRIAL FOR "THE MOTOR CYCLE" CUP.
 SEPT. 15-20.—A.C.U. SIX DAYS RELIABILITY TRIALS.

Public Schools M.C.C.

Competitors in the Surprise Competition on the 21st inst. meet at the ten-mile speed limit post out of Barnet on St. Albans Road at 2 p.m. The competition will consist of a run of about forty miles. Entries close on the 17th inst. Hon. sec., Mr. H. P. Browning, Riverbank, Staines.

Glasgow M.C.C.

The Glasgow Motor Cycle Club will hold a gymkhana on 21st inst. at Glebe Park, Largs. Many entertaining events are included in the programme.

Entry forms may be obtained from Mr. W. Muir, 20, Monteith Road, Glasgow.

Doncaster and District M.C.C.

After three years inaction, owing to the death of the late secretary, Mr. E. Goult, and the War, the old club, which has been one of the strongest clubs of the North, has again been formed, with Mr. J. Franks as new president and Bargrave D. Gray as secretary. A good strong working committee has been formed, and the first social run is fixed to take place on June 22nd to Roche Abbey. Mr. B. D. Gray, 3, Hall Gate, Doncaster, will be pleased to hear of, and give any help to, other clubs running through Doncaster.

South Birmingham M.C.C.

A protest made by T. Stevens was upheld at a committee meeting when the South Birmingham M.C.C. decided the results of the reliability trial described in our last issue. This alters the awards as below:

First in each class receives gold medal, second silver medal, and third bronze medal.

ABOVE 300 C.C.

1. T. Stevens (4¼ James and sidecar).
2. L. Newey (3½ Ariel and sidecar).
3. G. Dalby (4 Triumph).

UNDER 301 C.C.

1. B. Kershaw (2½ Imperial-Jap).
2. I. E. Clulee (2½ Allon).
3. A. Elleman (2½ Allon).

Westmorland M.C.C.

There was a good muster of motor cyclists at the recent annual meeting, held at the Commercial Hotel, Kendal. The prospects of reorganisation would appear to be excellent, but the competitions for the present season will be limited in number, owing to the lack of up-to-date machines. Officials for 1919 were elected as follows: Hon. sec., Mr. Joseph Wright; hon. treasurer, Mr. R. P. Montgomery; trial secretaries, Messrs. Arthur Moffatt and W. Westwood; auditors, Messrs. W. D. Stewart and F. A. Ireland.

Herts County A.C.

The committee of the Herts County Automobile Club desires it to be more widely known that there is a motor cycle section of the club to which the subscription is ten shillings and sixpence.

A new motor cycle committee is about to be formed, and a programme of competitions is in course of being arranged to include hill-climbs, reliability trials, consumption trials, speed-judging, and inter-club competitions, etc. New members are eligible for election to the motor cycle committee. Membership forms may be obtained from the hon. secretary at 173, High Street, Watford, Herts.

A RIVAL TO THE SIDECAR.

The Bleriot-Whippet, a Small and Speedy Runabout, to be Produced in Quantities.

THE runabout built by Messrs. Jones and Marchand and described in our issue of March 13th is to be marketed by the Air Navigation and Engineering Co., Ltd., of Addlestone, Surrey, and is to be named the Bleriot-Whippet. This company has an ambitious programme, and arrangements are well forward to produce some thousands of these small vehicles, the entire capacity of the works being devoted to their production. It is intended that the Bleriot-Whippet shall be essentially a rival to the sidecar and motor cycle, as speedy and as economical, but with equal comfort and weather protection to driver and passenger.

A view of the engine and countershaft, showing pulley contracted on high gear. Note the long square notched quadrant.

The 8-h.p. Bleriot-Whippet on the road.

Only the experimental model is running at present and, we are informed, certain alterations will be embodied in the standard production model. These modifications consist first in the fitting of an 8 h.p. Blackburne twin, of 85 mm. x 88 mm., with an outside flywheel and detachable cylinder heads. With this engine a single disc Ferodo-lined clutch will be fitted to the left hand extension of the crankshaft, and the starter will be altered. Originally, there was a lever on the near side of the car arranged to operate a rack and pinion, but in future the lever is to be placed within reach of the driver on the right hand side, and will control a segment meshing with a pinion connected, through a free-wheel, to the crankshaft extension.

The pedal brake will operate a V block working in the rear axle pulley, while the hand lever is to be connected to a

pair of expanding shoes housed in a drum on the countershaft.

Certain alterations to the body, wheels, and chassis sizes bring the wheelbase to 6ft. 9in., the track to 4ft. 2in., and the tyre size to 700x80 mm., but the change is so proportioned that the general lines of the machine remain unaltered. It is probable also that there will be a modification to the front axle enabling the car to be turned in the width of the average main road.

The ingenious variable pulley, with its cam-operated jockey sprocket to take up the slack in the engine primary drive chain, is retained, while the axle still has its large belt pulley in the middle.

There will possibly be two models, one completely equipped with hood, screen, lamps, etc., and the other a sporting model. The de Luxe model is not yet priced; but the latter is to cost about £175.

To Find a Winner by Efficiency Tests.

THE Midland Cycle and Athletic Club trial on the 28th inst. promises to be a most strenuous event, as the committee have set themselves the task to find a winner for the premier awards without resorting to the unpopular secret check or speed-judging. Some very prominent members of Midland sporting circles are behind the event, several of whom are connected with the manufacturing trade, and an honest endeavour is being made to organise a trial in which only the best riders on the best machines can obtain an award. The course is about 200 miles in length, and the trial will start at 6 a.m. on the first section of 80 miles, when a second "breakfast" will be partaken. After an hour's interval, there is a second section of 130 miles to the lunch stop of one and a half hours.

No adjustments will be permitted, and a severe brake test will be imposed on a

hill which will "discover" poorly braked machines. There will also be a stop and restart test on a hill, and also a flexibility test, the first part of the hill to be taken slowly, and the second part fast.

Competitors for this test will be divided into a number of classes, according to the type of machine, and their time ratio will be the slow divided by the fast time. The flexibility figure of merit will be the time ratio divided by the average time ratio of a certain number of the best time ratios in the same class, which will equalise, as far as possible, the chances of the different types and sizes of machine. From this test all the chief awards will be made if all other marks are equal.

Each competitor will be credited with 100 marks, and deductions made as follow:

Ten marks for any stops other than official ones.
One mark per minute for each complete minute late or early at any checked point.

Five marks for "footing" of any kind, or for dismounting and running the machine.

Five marks for failure at stop and restart test. Failure at brake test will mean disqualification.

The prizes are as follow:

The M.C. and A.C. Trophy, for the best performance of the day, irrespective of class.

The "Jordison" Trophy, for the best performance by any passenger machine.

The "Trader" Trophy, presented by the proprietors of our trade contemporary, *The Motor Cycle and Cycle Trader*, for the best performance by any solo machine of over 350 c.c.

The "B.N." Bowl, presented by the proprietors of *Bicycling News*, for the best performance by any lightweight machine of 350 c.c. or under.

In addition there will be three valuable prizes for the best performance by (1) a private owner, (2) a lightweight of 275 c.c. or under, (3) for the best performance by a club member.

Gold medals will be awarded to all riders gaining 100 marks and silver medals for ninety marks.

Entries close Wednesday (first post), June 18th. Entry forms may be obtained from the hon. trials sec., Mr. F. J. Urry, Lionel Street, Birmingham.

FEATURES OF THE ZENITH FLAT TWIN.

MR. F. W. BARNES, the former Zenith exponent, is responsible for two very practical inventions which will shortly be found on all Zenith machines. These are a saddle and a rim brake.

The saddle is a most practicable device, the seat portion being suspended on two quarter-elliptical springs clipped on to lugs fastened to the saddle tube, while the forward end of the saddle runs on a roller on the top tube.

As will be seen from the illustration, the saddle can be turned up so that the

The latest Zenith saddle.

seat is kept dry in the event of the motor bicycle being left out of doors during a shower of rain.

The whole device is exceedingly simple, and in use we found it to be most comfortable when we tried it on the new 2½ h.p. flat twin Zenith lightweight. This machine is quite a departure for this firm, and retains the well-known Gradua gear so long associated with Zenith Motors, Ltd. The engine follows more or less conventional design, having cylinders

60 mm. bore and 58 mm. stroke. Below the crank case is carried a countershaft driven by chain from the engine shaft, on which is mounted the expanding pulley gear forming part of the Gradua system.

Our short test revealed that the engine is practically vibrationless, and the gear all that can be desired, and we have no doubt that this model, when ready for the market, will be an extremely popular one.

The other invention refers to all models of Zenith motor bicycles, and is

A new belt rim brake.

a simplified and improved form of belt rim brake. This brake is an exceedingly clever idea, as it does away with the use of control wires. It can be brought into operation no matter where the position of the back wheel may be, whether slid forwards for high gear or backwards for a low gear ratio. By depressing the pedal the arm hinged on the carrier supporting the brake shoe is raised. As this arm is lifted it raises the bell crank on the brake shoe, moving the shoe with it.

A USEFUL CHAIN RIVET REMOVER.

WE have lately received a sample of an excellent self-centring chain rivet punch from Mr. Chas. Talbert, 73, Westbury Road, Walthamstow, Essex. The tool is made from solid bar

A self-centring chain rivet remover

steel with a rust-proof finish. As it is case-hardened throughout, it should wear indefinitely, and stand all the rough usage to which motor cycle tools are generally subjected when carried on the machine. Also, although of a convenient size for the work it has to do, the rivet remover is small enough to be carried in the tool roll.

It is made in two sizes, for chains of ½ in. pitch, ⅝ in. in width and upwards, and a larger size to fit ¾ in. and 1 in. pitch chains of any width. It is an exceedingly useful tool, which no rider of a chain-driven machine should be without.

"THE MOTOR CYCLE" ROAD MAPS.

THOSE motor cyclists who do not use road maps little realise their value on the road, and the entertainment they provide during winter evenings. There are many riders who make a habit of marking a map showing the roads covered during each summer, thus making a permanent record, and, by the time the picnic baskets are packed away for the winter, the map has become a key for many a fireside tour.

A map should be mounted on canvas if it is to be of good service to the motor cyclist, and also contained in a case for carrying in the pocket of the sidecar, or one of the pannier bags on a solo machine. The *Motor Cycle* road maps are prepared specially for motor cyclists, and are obtainable in a strong cloth wallet. Three maps comprise the set. (1.) England and Wales (scale sixteen miles to the inch); (2.) Scotland (scale sixteen miles to the inch); and (3.) London (four miles to the inch). Three grades of roads are clearly shown together with marks showing where garages and hotels are to be found. Road summits and intermediate distances between towns are also indicated.

The London map will be found invaluable to those who wish to get round London on a tour, such routes being marked in a distinctive colour. The price of the complete set, in case, is 4s. 6d., or, by post, 4s. 10d., and are obtainable from our publishing offices, 20, Tudor Street, London, E.C.4.

PARR-EAGLE RUNABOUT.

THE Parr Eagle Runabout, described in our issue for May 15th, has six speeds forward and a reverse. The accompanying illustration shows the gate for the gear lever, which is located and

located by the clutch pedal. It will be recalled that the engine of this little vehicle is a small V four-cylinder two-stroke set at 90°, and has a 180° crank.

A NEW IDEA IN TWO-STROKE ENGINES.

A TWO-STROKE engine in which the exhaust ports form an almost continuous ring round the cylinder, and has, adjacent, a similar ring of ports for transferring the new charge of gas, has been patented by the Imhoff Motor Co., of Switzerland.

It will be seen from the accompanying diagram that the top of the piston is roughly conical in shape and is fitted with radially arranged ribs intended to guide the incoming gas to the centre of the cylinder.

The piston is shown as being fitted with a large number of rings. Excepting during the admission period of the fresh gases, one of the rings is always upon the cylinder wall between the two series of ports. This is to prevent the mixture being sucked into the exhaust slots. A rotary valve controls the induction into the crank case from the carburettor.

A two-stroke engine of Swiss design.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

VALVE OPERATION.

Sir,—It may interest Mr. Pritchard to know I bought a J.A.P. 85×95 engine, as he illustrates, about 1909, and ran it for some years. Its faults were wearing of tappets and the noise; its advantages, impossibility of overheating, very high efficiency and economy, valve heads could not enter cylinder if broken, etc.

Why the firm ceased making it, goodness knows; for a better engine never ran.

A. E. PAYN.

Sir,—The letter in your issue of the 15th ult. by Mr. R. G. R. Pritchard recalls old memories. In 1910 I owned for a short time a locally assembled machine, built in 1904, with B.S.A. spring frame and originally 2½ Minerva engine hung on down tube. In 1905 this engine was replaced by a J.A.P., 82 bore × 76 stroke, overhead inlet and exhaust, both operated by one rod and cam precisely as suggested by your correspondent. The rod had a strong return spring, enclosed in the guide, which was of wide dimension. This old engine pulled well and ran very smoothly, but the ignition, being of the ancient battery type, with a most wretched contact breaker, festooned with wires, the engine never had a fair chance. In its heyday, however, this machine was considered rather hot-stuff, and, in some respects, was in advance of its time.

JOHN CONCHAR.

THE LEVIS CUP TRIAL.

Sir,—I should be glad if you would publish this letter to the effect that the disqualification of Mr. Greaves was one upon a technical breach of the rules, not involving any slur or discredit upon Mr. Greaves or upon his machine, the Calthorpe with Precision engine.

The Committee regret having to make the decision, displacing Mr. Greaves from first place, but rules are rules, and must be complied with.

PHIL. MOSEDALE.

Organising Secretary for the Sutton Coldfield and Mid-Warwickshire Automobile Club.

PETROL IN THE PEAK DISTRICT.

Sir,—This is for the benefit and warning of any of your readers touring on Sundays in the Peak District.

I left Sheffield for Buxton, *via* Middleton Dale, Tideswell, and Miller's Dale. On returning from Buxton I did not fill up with petrol, as I found I had sufficient in the tank to carry me to Bakewell; on arrival at Bakewell I called at a garage belonging to one of the principal hotels, and was told they had no petrol for sale, as they required all they had for private use, but, as I had just seen them supply a car driver with some this was clearly a get-out, and it is quite evident that motor cyclists are not encouraged at that garage. I then went the round of the town, calling at four other petrol dealers, and found them all closed, and I was told that they only opened on Sundays when they thought fit. As I had by this time only about a gill of spirit left to carry me to Sheffield, things looked pretty serious. However, I was then directed to Needham's Garage, where I received very different treatment, as, although they had no petrol in stock, they supplied me with all the benzole they had left (threequarters of a gallon), after which I went on my way rejoicing. I should therefore advise your readers not to rely on getting filled up at Bakewell.

ARNOLD E. WARD.

COASTING WITH THE EXHAUST VALVE RAISED.

Sir,—There is a very debatable question at present occupying the minds of motorists, and it is this:

When going downhill, with the exhaust lever fully raised, both petrol and air levers open, are the exhaust valves being burnt? Some contend that an explosion is taking place all the time, and is escaping through the silencer in the form of a blue flame. If this is so, what has one to do to get a current of air through the engine with the petrol lever closed, as both air and petrol go through the intake pipe. An expression of your readers' opinions would be interesting.

J. TAYLOR.

Ashton Court, Clifton, the venue of the Bristol Rally on the 21st inst. in connection with the A.C.U. first committee meeting in the provinces.

SPARE PARTS.

Sir,—*Re* complaints as to spare parts, I may say that I have ridden an Enfield combination for the last six years, and, as to despatch of spare parts, the promptness I received would take some beating. I had a small accident which called for a quantity of new parts. I rang the Enfield up on the Monday and received every consideration, and the parts were despatched the same day, fitted on, and the machine in use again. The usual disclaimer.

Birmingham.

Sir,—This is my experience of repairers. About three months ago I bought a motor bicycle which required attention to the engine-shaft. I sent the machine to a garage just before going for my Easter holiday, and on my return was informed that the shaft had been sent to the engine makers for renewal. After several letters to them, in a fortnight they informed the garage people that they could not deliver under three weeks. The garage people then sent a letter requesting the old shaft by return of post, as I could get one turned in a couple of hours. Although letters and telegrams have since been sent, they have not delivered the new or the old shaft.

I consider this far too long for a new shaft, and most discourteous not to return the old one.

Sheffield.

H.C.W.

Sir,—I have read in three of your different issues complaints about delay in delivery and "the usual disclaimer" about the promptitude of delivery.

In January I purchased a machine of well-known make. On April 8th I sent magneto (through my agent) back to the makers of the machine to replace broken shaft. This was nine weeks ago, since when I have heard nothing whatever concerning it, although I have asked for it to be returned as it is. My agent has written twice and I myself once, but we have had no replies.

DISGUSTED.

Glasgow.

MOTOR CYCLES FOR THE DISABLED.

Sir,—Much has been written recently on suitable machines for the disabled, and I think, perhaps, my experience will interest, at least, a certain section of your readers, especially those who, like myself, have a very limited purse, so that specially built machines with kick starts and other fancy contraptions are quite out of the question. War service has left me with a left arm about as useful as a missing rum ration, and is consequently nursed cosily away while the other does all that is necessary.

My mount is a 2½ h.p. two-stroke two-speed O.K. (an admirable little 'bus, in spite of its age), with fixed ignition, and just the right weight to handle single handed; and the following are manoeuvred with ease on the right handle-bar: exhaust lifter, front brake, air and throttle levers, and

horn; while the oil pump and gear are worked by the same hand, or the latter may be "slammed" in with the knee.

I might add that the machine is ridden in all weathers and traffic, and I am certain that any reader whose enthusiasm for motor cycling has been damped by infirmities, after the first mile or two, will gain sufficient confidence in the one arm to feel riding again a pleasure.

H.S.W.

Hitchin.

SCOOTERS.

Sir,—I have followed with much interest the discussion in your paper with reference to the motor scooter, and especially the controversy as to the fitting of a seat. As a keen motor cyclist who wishes to do what he can to forward the cause, in however humble a way, may I add my quota to this discussion?

I have seen it stated that the small diameter of the wheels accentuates the irregularities of the road surface. Surely this answers your question "Why Stand?"

For if one sits, with the roads in their present state, surely after a very short time there will be produced a condition painfully reminiscent of one's school days.

Winchester.

B.

MOTOR CYCLE PRICES.

Sir,—What you state with regard to the difficult position of the manufacturers is, unfortunately, only too true.

Although we do state, so far as quotations for L.M.C. machines are concerned, that we reserve the right to withdraw quotations without notice, we have all along executed orders for agents at the original price arranged, although subsequent alterations in price have been made. The only exception has been that we have reserved the right, naturally, to alter prices of stock orders agents may have placed, but this would not affect the public. In fact, we have taken steps which should in every case enable a purchaser who has paid a deposit to purchase his machine at the price originally arranged with the agent, i.e., the standard retail price current at the time of purchase.

THE LLOYD MOTOR ENGINEERING CO., LTD.

Sir,—Referring to the article under the above heading in last week's issue of *The Motor Cycle*.

We agree that raising prices without notice is a very hard rule, but, unfortunately, under present conditions, it is unavoidable. Increased prices of materials, also advances in wages, have not only to be paid without notice, but frequently retrospectively, giving the manufacturer no chance of recouping himself.

We are afraid it will be impossible to have fixed prices until more normal conditions prevail.

DOUGLAS MOTORS, LTD.,

WM. ROSSITER, Secretary.

A picturesque scene in the ancient village of Edge. The tower in the background was built to commemorate the battle of Edge, and is visited by thousands of motor cyclists in the course of a year. The scene shown was on the occasion of a recent trial held in the district.

A one-armed rider of a two-stroke Sun-Villiers, who lost his limb during the war, yet manages to manipulate his machine quite easily.

DISCOURTESY ON THE ROAD.

Sir,—On Thursday evening, May 22nd, I was riding my Rex combination, with my wife in the sidecar, to Bath Theatre, and when about four miles from Bath, on a hill known as Sally in the Wood, I saw an R.A.F. officer, obviously stranded with a motor cycle by the side of the road. I hailed him in the usual way, and asked him if he needed assistance, and on stopping found he had a nail through his back tyre, and no tools or repair outfit to effect repairs. I offered to help him for ten minutes, and he dropped his rear wheel out, and I helped him get the cover off. Being pressed for time, he suggested I might lend him my kit of tools and repair outfit, saying he was coming on to Bath and would bring them to any place I would name. I therefore told him to leave them at the theatre box office, but up to the evening of May 26th there was no sign of them.

The officer mentioned that a rider on a Triumph had passed him and laughed at his trouble, and I am thinking he is better off than I am.

This officer was riding an 8 h.p. Zenith, 1915 model, and was reading *The Motor Cycle*. He had of me a new large size Patchquick outfit, three tyre levers, and a large King Dick spanner.

I should be very glad if you would make mention of this in your next issue. It does not always pay to act the good Samaritan.

C.E.F.

Trowbridge.

Sir,—Mr. C. J. Williams is perfectly justified in asking that the old-time courtesy of the road should be re-established.

Previous to the war I rarely had to stop for trouble without some passing motor cyclist slowing down and calling out an interrogatory "All right?"

Since being demobilised in February last I have driven my combination about 1,500 miles, and although I have had

several stops for trouble, on two occasions only have passing motorists asked if they could assist me. One of these two, I might add, was the driver of a large car.

Only recently I was hung up outside Worthing with a puncture, and, although seven or eight motor cyclists passed, only one slowed down to ask if he could assist.

My experience during the past four months has made it quite clear that the pleasant old-time courtesy of the road has practically ceased to exist.

W.W.B.

Rusper.

AMERICAN TWINS.

Sir,—To accept "Ixion's" comments *re* American twins (issue of May 15th) as being "without animus" is somewhat of a "psychological problem," until one remembers the five-bob-a-time thrusts at John Henry; then one understands.

Many agents, with their tongue in their cheek, and their minds on the higher profit, gave the natural life of the Americans as twelve months. "Ixion" lends colour to this, and I suppose, when the Detroit duds begin to understand a little of steel alloys and heat treatment, they may possibly prolong their life by a month or two.

One of the most progressive and successful British twin makers, who is turning out what is "some" new model, is embodying many of the points decried by "Ixion," including the "semi-woolly" engine.

High compression, high efficiency engines have their supporters, but thermal efficiency rarely troubles the average rider, and American twin owners willingly allow useful calories to slide out of their exhaust pipes for the advantage of that "tick over" and absence of knock when climbing on top gear.

"Ixion," of course, is aware that it is the practice of American twins to seize up every few miles. What else could prompt his "mechanical lubrication of a kind"?

I may say that I eke out a miserable pittance by vivisection and holding post-mortems on the mechanical contrivances which are the primary subjects of your excellent publication, and I have yet to discover something that will commend itself to me like a certain Milwaukee production, yet when the like hails from the Midlands I will readily acclaim it.

GEORGE MAGGS.

A SATISFACTORY LIGHTWEIGHT.

Sir,—May I be permitted through your columns to express an opinion of what I consider an ideal motor bicycle?

I bought my machine second-hand for a figure which is very little in excess of what is very often given for an ordinary push-bicycle. It is an ultra-lightweight, scaling about 100 lb. I have ridden it for business and pleasure purposes for five seasons, covering upwards of 10,000 miles. I have never been hung up on the road. I have never attempted any freak hills, but rain road hills never trouble me, as, a variable gear being fitted, pedal assistance is seldom, if ever, required. The size and weight of my machine enable me to lift it in and out of an awkward gateway with comparative ease.

A jockey pulley takes up the slack of the belt when the gear is altered. People suggest that the jockey is a disadvantage, but I fail to see it, as the lower the gear is the more the Whittle belt encircles the pulley on the engine, and thus a better grip is given when there is climbing to be done.

My average speed is not thirty-five miles an hour, and I do not want it to be, both for my own sake and also that of others who have as much right to use the road as I have. I averaged just under twenty in a run from London to Norwich, and stopped once on the way to fill up the petrol tank.

Finally, this old 1911 2½ h.p. Motosacoche takes me wherever I want to go with practical certainty. Although I weigh over 12 stone, on a long run I get 150 miles to the gallon, and starting troubles are practically non-existent. I very rarely have to run the machine more than three yards, or, if I wish, I can get a standing start with the aid of the jockey and free engine.

I attribute my success with this little "Motor Sausage" to treating it as a pal and not as a slave, tuning it carefully, renewing parts as they wear, and not trying to improve on the makers' design.

HAROLD WILLMOTT.

T. W. Loughborough, A.M.I.A.E.,
Secretary.

Are You Insured?

The mishaps that may overtake the most careful of motorists are numerous. It behoves every rider to insure both himself and his machine.

To encourage motor cyclists to take out a complete Policy under Table 3, such policy holders are admitted to full membership of the Auto-Cycle Union at one-half the usual subscription.

The A.C.U. Insurance Policy provides for every contingency, and its terms bring it within the reach of everyone who can run a motor cycle.

It is a straightforward contract, affording exceptionally generous benefits. Its conditions are stated clearly and without ambiguity; and you are invited to compare it in every particular with other policies.

The A.C.U. Policy is issued by the Law Accident Insurance Society, Ltd., a company of the highest standing; who have agreed that in the rare event of a dispute between themselves and a Member of the A.C.U., the decision of the A.C.U. Committee shall be final.

**Wood-Milne***Keygrip***MOTOR CYCLE TYRES**

If you would know what it is to be absolutely free from tyre trouble, to be able to negotiate the "toughest" piece of road without wondering "what is going to happen next"—or finding out, then fit the new Wood-Milne "Keygrip" Tyre.

These tyres are made on the most generous lines, and the very heavy tread gives a degree of comfort hitherto unknown.

With "Keygrips" on, it is good-bye to aches from jarred wrists and back.

THE HIGH-TENSION MAGNETO.

Its Theory and Construction from a
Beginner's Point of View.

NUMEROUS articles have been written dealing with the construction and the theory of operation of that most interesting machine, the high-tension magneto. The descriptions, or explanations, given by most writers usually come under one of two headings—either they are extremely technical, and are understood only by the electrical engineer, or they are so very practical that the actual theory of operation of the machine is given a wide berth, presumably to avoid puzzling the reader.

Fig. 1

Considering that everything depends upon the proper functioning of the magneto, it is surprising the apparent lack of interest on the part of motor cyclists concerning this really wonderful little machine. But for its advent, the evolution of the motor cycle would not have progressed to its present stage, as more than half the troubles of the early motor cycles were connected with the ignition apparatus. To-day, although the least understood part of the machine, probably it is the most efficient.

This article is written in an endeavour to make quite clear to those possessing only a slight knowledge of electricity exactly how the high-tension magneto generates the high voltage necessary for

is most unique, it is still quite simple and understandable by any practical mind.

Apologia.

The explanatory matter is devoted exclusively to magnetos of the revolving armature type, as the majority of magnetos in use to-day are constructed upon this principle. Also, the writer is of the opinion that, if the working principle of this type is once comprehended, the operation of any other type becomes obvious upon examination of the machine. It is, perhaps, needless to point out that magnetos, while designed by electrical engineers, are simply components of a much larger and more complex class of machinery, which is designed and built by the mechanical engineer, and, as the satisfactory performance of the internal combustion engine is so largely dependent upon the quality of the ignition apparatus used, it behoves the designer, builder, and operator of this class of prime mover to acquire as much knowledge of the construction and operation of the high-tension magneto as possible.

In attempting this explanation the writer has taken the liberty of departing more or less from the orthodox text book style, and in some cases has quite ignored scientific reasoning, in an endeavour to make the explanation as clear and as understandable as possible.

The Parts of a Magneto.

The high-tension magneto of the revolving armature type consists of:

(1) The magnet system (fig. 1), comprising one or more permanent magnets and two soft iron pole shoes or pole pieces. These pole pieces are shaped to embrace:

(2) The armature (fig. 2), which consists of a soft iron core laminated in the centre and of the usual H shape or shuttle

type. This core has two windings wound upon it. One, called the primary, is wound next to the core, and consists of about two hundred turns of copper wire about .023in. in diameter. The second winding, called the secondary, is wound over the first, and contains from 7,000 to 8,000 turns of copper wire, usually about .004in. in diameter. The greatest care is necessary in insulating these windings, as the voltages are very high, and the space for insulation is limited. The inside end of this secondary winding is connected to the outside end of the primary winding. This serves as an earthing connection for the secondary. The outer end of the secondary winding is connected to the slip ring or collector, and from here the spark current is con-

veyed by means of a collector brush and connection stem to the spark plug. To the ends of the armature core are screwed and dowelled two end plates made from some non-magnetic material, usually gun-metal. One end plate is hollowed out, and in this cavity is placed:

(3) The condenser (fig. 3), consisting of a large number of thin tinfoil sheets separated by somewhat thicker sheets of high-grade mica. Alternate sheets of tin-

Fig. 2.

jump spark ignition, and the writer wishes to state here that, although the high-tension magneto, as a machine,

Fig. 3.

Fig. 4.

The High-tension Magneto.—

foil are connected together by means of the tabs, as shown, thus giving a large plate area in a small compass. The mica plates with the tinfoil sheets between are assembled into and clamped there by two sheet brass clips. These clips make electrical connection with the tinfoil tabs, and thus serve as terminals for the condenser, as well as means for holding the assembly together. One of these brass clips has a small ear or tab projecting from the side, which, in the majority of magnetos, is simply fastened to a step in the condenser end case by means of a small screw, and serves as an earthing connection for one terminal of the condenser, and, in some makes of magneto, also for one side of the primary winding and the inside end of the secondary winding.

Fig. 5.

Note.—Some types of magnetos have the inside end of the primary winding earthed right to the armature core, this type of construction making it unnecessary to bring out both leads of the primary winding.

The opposite condenser clip makes electrical connection with, and by means of being riveted to, a gunmetal base or plate on the back of the condenser. This base has projecting from its centre a stem, which passes through an ebonite bushed hole in the condenser end plate spindle. This stem makes electrical connection by means of a screw A (fig. 5), and the screw also serves to hold in position.

(4) The contact breaker, which consists of a gunmetal base with a hollow tapered projection on its rear or bottom face. On this base is mounted the necessary contact making and breaking mechanism, which interrupts the primary circuit at certain intervals during the rotation of the armature. It will be noted, by referring to the semi-diagrammatic layout of the armature and its components, that when everything is in order the armature, together with the condenser and contact

breaker, form one rigid assembly, which rotates within the carcass or frame of the machine. The bearing bracket at the contact end of the magneto carries a sleeve, which may be oscillated in a rotational direction through an angle (in the majority of magnetos) of about 30°. This sleeve carries the cams, which are simply pieces of case-hardened steel, semi-circular in shape, and chamfered off at the ends. The oscillation of this sleeve carrying the cams permits of advancing or retarding the point of ignition. The cams project from the inside surface of the oscillating sleeve, and engage at certain intervals the rocker or movable

arm of the contact breaker. By this means the contact breaker points are opened at the proper times. At other positions, when the rocker arm is not engaging with the cams, the contacts are held together by a spring.

The Electrical Circuit.

In tracing the path of the current we find, first of all, that the ends of the primary winding are connected to the two condenser terminals or clips, and that one of these clips is connected to the condenser end case and through the metal of the case to the base of the contact

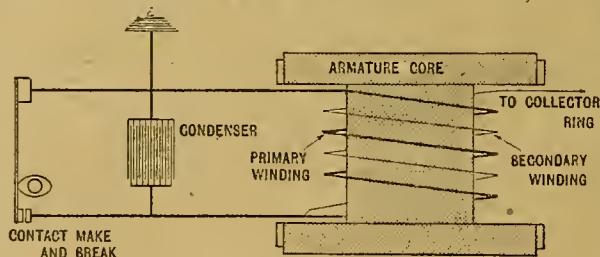

Fig. 6.

breaker. The other condenser clip and terminal combined makes connection with the centre block of the contact breaker via the gunmetal condenser base and the contact breaker retaining screw A (fig. 5). The outline of this circuit can thus be represented by the simple diagram (fig. 6).

Note.—The diagram shows that the contact breaker short-circuits the primary winding, and that the condenser is connected in parallel with the primary winding and the contact breaker. Now, suppose the coil of wire represented by the primary winding to be rotated in a magnetic field in such a manner that the flux or magnetic lines of force passing through the centre of the coil is constantly varying from zero to maximum, back to zero, reversing and rising to maximum again, and so on continuously. Obeying the fundamental law of the generation of an electro-motive force, there will be a current set up in this primary coil which is constantly varying both in direction and magnitude as the armature revolves. It is important to note here that the current flowing in the coil (primary winding) is only present when the contact breaker points are closed. When the contacts are open there is no current flowing in the winding, but because of the coil continuously cutting lines of force due to the rotation of the armature, there is an e.m.f., or potential difference or voltage, present across the contact points. This e.m.f. is constantly varying in polarity and magnitude as the armature revolves.

It is a fundamental fact that, whenever a current flows through a coil, there is a magnetic field set up by the current, and if the coil does not contain an iron core the strength of this magnetic field is proportional to the value of the current flowing. If we add an iron core the strength of the magnetic field produced by the current is enormously increased, this increase depending upon the quality of the iron.

Now, as the armature revolves in a magnetic field, and, as we have just learned, if the contacts are closed, the armature also has a magnetic field of its own, there must be some distortion or displacement in the permanent magnetic field produced by this second or created field. In the attached diagrams two conditions are presented.

(To be continued.)

READERS' ROAD REPORTS.

WEEK by week we publish reports as to the condition of the roads sent to us by readers who go to this trouble for the benefit of their fellow motor cyclists. The following are culled from this week's mail bag:

We are informed that the road from Bristol to Gloucester via Thornbury is in a very bad condition, and motor cyclists are advised to take the road through Chipping Sodbury, Old Sodbury, and Nailsworth.

A reader's report of the London-Exeter road: London-Exeter road via Dorchester.—London to Guildford good,

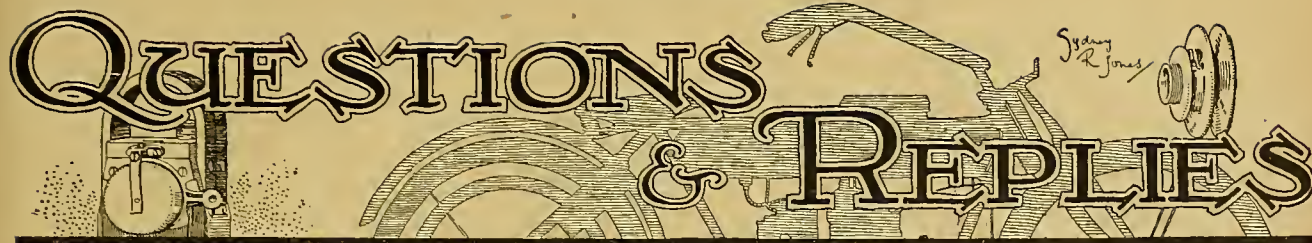

rough through Farnham, loose on to Winchester. From Winchester through the New Forest road fairly good, but loose in places; bumpy into Dorchester. Dorchester to Bridport full of pot-holes; Bridport to Lyme Regis very rough, and the condition of the steepest hills is very bad, so bad that near Lyme Regis the silencer touched the ground and a piece was torn off the end. Lyme Regis to Seaton fairly good. The road back to Town, via Chard, Crewkerne, and Yeovil, is very much better.

Main road Dollar to Stirling: Badly cut up and patched with tarred chips.

Loaninghead-Glenhead road through Gleneagles: Very rough.

The roads in the South of Ireland, in Counties Tipperary and Waterford, are in excellent condition. This applies also to byroads; but in Limerick, Clare, and parts of Cork they are reported to us as not being fit for horse-propelled vehicles, not to mention motor vehicles. Our informant also tells us that garages, except in the cities and one or two large towns, have no experience of motor cycles, or else do not wish to be bothered with them, but the inhabitants generally are very well disposed toward tourists.

QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

The Treatment of Belts.

? My machine is a 5-6 h.p. Rudge Multi, and to save the wear and tear to which rubber belts are subjected I have started using a leather belt, but find that it will not grip on the pulley while ascending any gradient. Is there any special treatment that has to be given to leather belts before using them? If so, I shall be very grateful for the information.—W.B.

The belt is probably not sufficiently tight. It possibly has also got dry and hard, and the surface needs to be scraped and then well soaked in collan oil, obtainable from most saddlers.

Timing a Twin.

? I have timed the magneto of my 6 h.p. twin Rex in different positions but it will only fire in the front cylinder, with occasional explosion in the silencer from the back cylinder. When at top speed it picks up better, but it is almost impossible to reduce speed without the back cylinder ceasing altogether. Can you kindly suggest any reason for this?—C.S.

You should remove the rear plug and note whether you get a spark on revolving the wheel. It is sometimes advisable to have the plug points in the rear cylinder set slightly wider than those in the front. Try changing over the plugs, also see that there are no air leaks in the induction pipe, that the valve guides are not much worn, and examine the carbon brushes.

Misfiring at Slow Speed.

? I have recently purchased a new 2½ h.p. Calthorpe-Jap motor cycle, fitted with an Amac carburetter, and have now driven it 300 miles, but I find I cannot cure bad misfiring on both gears at slow speeds or when running light down hills. There is no sign whatever of misfiring while climbing hills, or while gathering speed, or when travelling at twenty miles per hour. I have tried jets from 24 to 30, and three kinds of plugs, but with no effect.—W.A.

Without actually seeing the machine it is very difficult to say what is the matter with it, as the symptoms described may be attributed to a variety of causes. For example, improper carburetter adjustment, air leaks at the carburetter or induction pipe unions, leaky air or throttle slides, worn inlet valve guides, etc. Perhaps a little larger jet might cure the trouble. Try setting the plug points a little wider apart.

Magneto Trouble.

? Would the magneto sparking at the points cause the spark at the plug to occur at the wrong time for firing charge? My Douglas has been laid up two years and will not fire petrol squirted into the cylinders, although there is a good spark at the plugs. I have taken contact breaker off and find insulators all right.—A.W.G.

Your magneto sparking at the contact breaker suggests that the condenser is broken down. This trouble, however, should not cause any alteration in the timing of the spark, so before doing anything further you should check the magneto timing and clean the condenser connection.

Buying for Another.

? I was asked by a friend (a novice) to go with him to inspect a 4 h.p. 1912 motor cycle and sidecar which he considered purchasing. I examined the machine, which was in a very dusty condition, owing, the owner informed us, to his not having had time to clean it. Everything seemed to me to be in good order, and he gave me a short run in the sidecar. On my recommendation, my friend paid a deposit to secure the outfit. Two days later the owner gave my friend a lesson in driving, and, after his paying the remainder of the money, let him take the machine home. I was not present on that day, but the day after, intending to go with him for his first run, I was seated in the sidecar, and discovered that the tube from the seat-pillar was broken right through where it enters the socket on the crank case, also that it had been welded either by the late owner (who on being shown the break, which was an old one, denied all knowledge of it, or of sharing the expense of having it repaired) or by some amateur. It seemed to me as though the break had been covered by the clip band that carries the pump, and that the vibration must have caused the band to slip off. Your advice on the matter would be greatly esteemed.—W.J.T.

Whether the purchaser of the machine can recover any damages from the seller depends upon what representations were made when the machine was purchased, and whether the purchaser relied upon such representations. If there were no representations he cannot have any claim, and even if there were it might be very difficult to claim, as apparently he did not rely upon any such representations but

desired you to advise him as to whether he should purchase the machine or not. Apparently you advised him to the best of your ability. If you did not receive anything for the advice we do not think anything could be claimed from you because the advice was bad; but if any charge was made, then you would be liable if the purchaser could say that the advice was given negligently, and without proper care. At the same time it must be remembered that the machine was second-hand, and one cannot expect guarantees with such mounts.

Repairing a Two-stroke.

? I have a 2½ h.p. Levis on which the exhaust pipe joint blew out. I got some ½ in. sheet asbestos and made a new joint, but when I tried to start the machine again it would only just puff and not go, and made a terrible knocking sound. The oiling system is all right, and it is not over-lubricated. I have cleaned the carburetter, but it seems to flood at the bottom.—J.L.

It looks very much as though you had cut the hole in the washer too small, and it was restricting the outlet of the exhaust gases. If petrol runs out of the carburetter when standing, the level may be too high, the needle may require grinding in, or the float may be punctured.

The Attachment of Magneto Sprockets.

? My machine has been laid aside for over two years and I have begun to overhaul it, but have met with the following difficulty. I began by removing the aluminium cover from the gear driving the magneto, but I am unable to remove the two small wheels—one from the engine, the other to the magneto—which carry the driving chain; do these simply draw out or do they screw out? I note that the spindles are threaded, but apparently not for the wheels in question, or are they held on the other side? If so, how is the crank case removed? The engine is a 3½ h.p. 1912 Precision.—G.E.G.

The magneto chain wheels are usually held on a tapered shaft by means of a nut. It looks as if in your case the nuts had been removed at some time, and if this is so the sprockets can be withdrawn by means of a special tool made for this purpose, such as is supplied by Lake and Elliot, Ltd., Albion Works, Braintree, Essex, and such firms. Otherwise you may be able to remove them by gently tapping two wedges behind them.

Loss of Compression.

? I have a 1911 or 1912 2½ h.p. twin Humber, which has run very satisfactorily until this season. Now I find it has practically no compression at all. Would you tell me if there is any other cure for it than having the cylinders rebored, fitting new pistons, etc.?—S.T.H.

Presumably the valves are compression-tight? If you remove the cylinders you will probably find that the cause of the loss of compression is one of two things, either the cylinders are dry through the oil having drained away with standing, or the rings are stuck with carbon or congealed oil. In any case you will probably find that new rings, properly fitted, will cure the trouble. It would be as well also to check the tappet clearance.

Running on Benzole.

? I have a 4 h.p. Triumph on order, and intend partly to use benzole, which I suppose gives more power. Is this extra power harmful to the engine and transmission of a single-cylinder machine? If not, what proportion of benzole to petrol do you recommend? I believe two parts of benzole to one of petrol is very satisfactory. Is it necessary to decarbonise more frequently with benzole than with petrol?—L.K.W.

Benzole gives a little more power, and there is a complete absence of knocking. It is not harmful to the engine. An excellent mixture is two-thirds petrol and one-third benzole, or even half and half. It is just possible that you may have to decarbonise a little more frequently with benzole, though the carbon is soft and easily removed, but this may be obviated by ensuring an adequate supply of air.

A Composite Machine.

? I have the offer of an Indian motor cycle, and should be obliged if you would answer the following questions: (1.) The seller of the machine reckons it to be a 1911 3½ h.p. model. Is that correct? (2.) It has an automatic inlet valve. Is this serviceable, and could it be replaced if anything was to go wrong? (3.) It has a low-tension magneto, and has to be connected with a transformer to make the spark. Could I fit a modern magneto? (4.) There is a chain wheel of about 12in. diameter fitted on the crankshaft, and the drive is by chain to the two-speed gear box and belt. Is this serviceable? The belt pulley is at least 14in. in diameter. (5.) Would this machine pull a cane sidecar? I am only bothering with this machine because I regard it as a novelty. It has leaf springs in the front and is sprung at the rear by some style closely resembling the new Douglas. Do you think £20 about a reasonable price for the machine?—E.A.W.

We do not recognise the machine you describe as any standard make. It is certainly not an Indian. The automatic inlet valve is quite serviceable as far as it goes, but an engine so fitted is not as efficient as one with mechanically operated valves. You could certainly fit a modern

magneto. Chain-cum-belt drive is quite a good form of transmission for solo work. The machine should certainly take a sidecar. The present value of the machine depends entirely on its tune and general condition; it seems to be a machine assembled from second-hand parts and £20 should not be too little.

A Leaky Petrol Tank.

? (1.) I should be glad to hear if you would advise me to dismantle my petrol tank. On giving the engine a run in the garage, I noticed petrol leaking between the cylinder and crank case. I stopped the engine at once, and, on taking out the crank case plug, found it flooded with about a pint or more of petrol. The only way I can account for this is petrol from the tank leaking into the oil chamber, and to get at the leak the tank will have to be taken apart. I cannot see how this is done, as it seems all in one piece. (2.) My carburetter is giving me trouble. The engine used to tick over in free, but now it races and stops: how can I get it to run slowly?—C.W.

(1.) Evidently the cause of the trouble is a leak from the oil compartment to the petrol compartment. Do not attempt to repair the tank yourself, but either send it to an expert tank-maker or to the makers. (2.) The trouble is probably due to a choked jet or to an air leak at the carburetter or induction pipe union.

EXPERIENCE WANTED.

"C.E.C." (France).—A motor cycle engine used as the motive power for an electric light plant in a small house, or to drive a circular saw, etc.

INFORMATION AND ADVICE WANTED.**Questions for D.R.'s.**

(a.) Will some D.R. inform me what type of oil some of them are using out here in France on their Triumphs? On various occasions I have noticed the smell of oil strongly reminiscent of my aero "flips," which points to the use of castor oil. If this is the case, is it found satisfactory, and what quantity is used

to mix with the usual motor cycle oil? (b.) I have noticed the use of the old corrugated flexible rubber tubing joining the box respirator to its canister for a handle-bar 'grip. Looks effective; practically, is it good?—A.W.G.M.

READERS' REPLIES.

If your correspondent "A Constant Reader" in *The Motor Cycle* of May 22nd cares to write to me, I can give him some useful tips on low-tension magnetos, having used one for nine years on an old pattern Singer motor tricycle.—FRED C. KING.

Encouragement of Inventors.

IT is very desirable that fresh brains should constantly be brought to bear upon all motor cycle problems, for only in this way can rapid progress be ensured. The most revolutionary, and sometimes the most valuable, inventions are often made by men who are not connected, or even in close touch, with the industry to which the inventions apply. That this should be so is not in itself surprising. When the man who has been trained in automobile engineering is called upon to think of, for instance, a gear box, his mind naturally turns to orthodox practice, and he passes in review the many gear boxes, the standard models of various firms which differ indeed in detail and possibly in method of operation, but largely follow the same general principles. It is not, then, astonishing that he, having these examples—excellent examples, too—in mind, should turn to the improvement of existing design rather than to the production of something entirely new and original.

On the other hand, it is most important that an inventor who has ideas which he believes to be new should make himself acquainted with what has already been done in the same field; otherwise he may find to his sorrow that he has been wasting his time and energy on something which has already been produced, and possibly discarded for some reason not readily apparent.

A few years ago there was little inducement offered to inventors to proceed with inventions of which they possessed the nucleus. Neither the inventor nor his inventions appeared to be wanted by those with the capital to develop them, and there appeared very little return for any innovation except to the patent agent and the Patent Office.

The inventor, too, has suffered through lack of encouragement and advice, and here *The Motor Cycle* has, for many years, endeavoured to assist. The file volumes of this journal form a complete record of the development of the

motor cycle, and contain many hundred descriptions of patents and ideas of more than ordinary interest. It has always been one of the objects of the journal to encourage new thought in design and principle, and our periodical reviews of current practice and inventions are written with a view to assist, by constructive criticism, all who are interested in the evolution of the motor cycle.

The War Motors Association.

THIS journal has long urged that some scheme should be adopted to enable ex-officers and men to purchase motor vehicles from among those not required by the Government at a reasonable figure. The Auto Cycle Union, too, has done much valuable work in this direction. The War Motors Association, 240, High Holborn, London, W.C.1, has now been formed with this object in view. The Association has arranged with the Disposal Board of the Ministry of Munitions to purchase on the best conditions a large number of motor vehicles at reasonable prices. Only two and a half per cent. has been added to cover administration charges, and there is no question of profiteering.

The vehicles will first be sold to wounded and disabled officers and men to whom a car or motor cycle is a real necessity. It is not clear at the moment whether there will be any advantage in purchasing price to ex-members of the Forces, or whether they will enjoy a preferential opportunity of purchasing machines at market value. A technical committee is advising men as to the most suitable vehicles for their particular requirements, and gives practical assistance free of charge.

The Association is working in conjunction with all societies which have as their first object the welfare of discharged officers and men of H.M. Forces, and arrangements have been made with the Central Committee for the Employment of Discharged Soldiers and Sailors.

THE FAMILY SIDECAR

Its Influence on Social and Domestic Life.

THE outstanding feature of post-war motoring, undoubtedly, is the large number of family sidecars to be seen on the road. Irrespective of the power or date of the machines, sidecars of all types are made to accommodate whole families and, in addition, picnic equipment, enabling the party to be independent of restaurants.

What is more surprising, perhaps, is that, apparently, every member of these parties is comfortable, despite the fact that imagination prompts one to believe only a jig-saw can rival the intricate manner in which lower limbs are interlaced.

We have heard of families of two adults and five children taking a trip from the Midlands to Blackpool on $3\frac{1}{2}$ h.p. sidecars, and have listened with concealed amusement to the explanations of the owners as to why they were compelled to send "some of the luggage and the eldest boy" by train.

The reason "some of the luggage and the eldest boy" is not accommodated on a machine is usually because the limit had been reached as regards space, for with many of these family men it is space, and not power, that limits the load. The rider of the old school fits as light a sidecar as he can obtain if he uses a " $3\frac{1}{2}$ h.p." for passenger work, and has an uncomfortable feeling most of the time that he is not giving the engine a chance. Such thoughts rarely

trouble the family sidecarist of to-day—and it is a tribute to the two or three-speed motor cycle that things do not happen to compel these owners to consider their engines a little more.

Bearings wear more quickly, of course—depreciation is more rapid, perhaps; but, everything considered, the average family man obtains more value out of his machine than the more fastidious owner, and gives pleasure to the whole family, uniting man and wife and children with one common interest, which makes for domestic happiness.

Many of these family sidecars are owned by newcomers to the motor cycle fraternity, who reap the benefit of the pioneer work done by *The Motor Cycle*, which, for six years, ploughed a lone furrow in motor cycle journalism and so prevented the threatened demise of the industry when motor cycles were unpopular and unreliable. To *The Motor Cycle* campaign and the A.C.C. trials is due the change-speed gear as a general fitment on motor cycles, which

Happy owners who believe in sharing their motor cycling pleasures. Apparently only the accommodation of a five-seated car can excel that of a sidecar outfit!

The Family Sidecar.—

makes them suitable for passenger work. Less than a decade ago, a $3\frac{1}{2}$ h.p. machine was quite unsuitable for sidecar work, and, while we think that an engine a little larger is to be recommended when a sidecar is attached, to-day the average " $3\frac{1}{2}$ h.p." will not only "take" a sidecar, but the average family in addition—and do it well.

In addition to the week-end runs so popular with the family man, the machines usually are used to transport the family to the "sea-side" for the annual holiday, and this year undoubtedly we shall see large numbers of these outfits on the roads to the coast. A man with two children thus makes a substantial saving over the cost of railway fares, and the figures below form an average comparison.

Those motor cyclists who take the present-day motor cycle for granted owe their pleasure to a handful of pioneers—both riders and manufacturers—who struggled for years because of their faith that eventually the motor cycle would attain the popularity it enjoys to-day.

DISTANCE, 150 MILES EACH WAY.

	£	s.	d.		s.	d.
Return railway fares				Benzole for sidecar		
for two adults ...	3	15	0	at 75 m.p.g., four		
Ditto for two children ...	1	17	6	gallons at 2s. 9d. ...	11	0
Incidentals ...		5	0	Oil and incidentals ...	5	0
	£5	17	6		16	0

Seating a child on a hassock in the toe of a sidecar relieves the passenger of much discomfort.

As to the cost of running the outfit at the week-ends, it is probably true that it costs no more than the amount a man at a "loose end" will spend on recreations in which his wife and family do not participate.

No doubt sidecaring as a family pastime will do much to influence domestic happiness. It binds all—father, mother, and children—together with one common interest and prevents the disintegrated household one often finds, where each member of a family has to find his or her own amusement. A week-end on the road is a most valuable tonic to a tired woman, and breaks the deadly monotony of housekeeping that disgruntles many a worried wife and mother. The week-end on the sidecar with picnic baskets and children breaks up a long procession of 365 colourless days into five-day weeks of pleasant reminis-

cence and anticipation, each divided by full-of-incident journeys into country which otherwise they would rarely see.

Apart from the health point of view, the education of the children is improved, and they are better able to absorb their school lessons because their wits are sharpened.

In short, the sidecar is a real boon to the family man, and he is not slow to realise this. It behoves sidecar manufacturers to remember his special requirements when designing new models and to allow plenty of space and strength.

Four B.S.A. owners making the utmost use of their outfits. Eleven passengers were on this occasion easily conveyed on four outfits through the most beautiful scenery in Wales.

OCCASIONAL COMMENTS

BY "IXION"

The Life of a Machine.

AMONGST my consultants last week was a rural postman, recently discharged from the army. His savings, including the gratuity, were sufficient to buy a motor cycle. His round averages about 120 miles per week, and he is allowed 32s. per week for the expenses of transport. In pre-war days he used a horse and trap. The questions put to me were whether the 32s. weekly allowance would cover (a) upkeep and (b) the purchase of a new sidecar outfit every third year. It is curious that so many people arbitrarily set the useful life of a motor cycle at three or four years. The plain fact is, of course, that motor cycles should be classed with women's hats and frocks—they do not so much wear out as pass out of fashion. I know that certain fluffy confections of tulle and chiffon look shabby after half a season, but though their pristine grace may be lost, they could still serve their original purpose of covering heads or bodies as efficiently as in their first youth. In practice, of course the smartish sort of girl passes them on to her maid or a poor relation long before they are genuinely shabby. This is how at least five riders out of ten treat a motor cycle. They run the newness off it, and then dispose of it to a poorer and less fastidious owner; the next season finds them with a new mount. Here and there you may find an owner who compares with an ancient lady of much local repute in my county. Her clothes are bought to last. Her Sunday hat and mantle were built by a first-class dressmaker in the year one—indeed, her grandmother probably wore them at Queen Victoria's coronation. Every five years or so she adds a bit of new ribbon or a few jet beads, but the enduring substratum of both articles defies the march of centuries. A motor cycle subject to certain obvious conditions can be similarly maintained.

The Cheapest Way.

IF I were a rural postman with a gross capital of, say, £75, I should not dream of buying a new machine every third year. I should select a first-class machine of tolerably simple specification, produced by a firm which does not come out with revolutionary novelties every spring and possesses a good name for supplying obsolete spares. After twelve months the machine would have done about 7,000 miles, allowing for a little Sunday joy-riding. I should expect to renew the chains, and possibly to have the engine bushes attended to. At the end of the second season (say, 14,000 miles), the gear box and spring fork bearings might profit by an overhaul: any scaled or chipped enamel might be retouched to avoid rust: there might be a few spokes loose, and the wheels

might therefore be trued up and their rims enamelled: one or two Bowden wires should perhaps be replaced, etc. Each year would call for a few minor jobs of the above character, but, surveying the machine's probable record over a long term of years, I can foresee no really bulky replacements with two probable exceptions. The first is the cylinder; the bore would unquestionably become enlarged and ovality would develop; the effects would become serious after perhaps 20,000 miles, and I should then have to choose between re-boring it and fitting a larger piston (with the result that the engine must be rebalanced), or buying a new cylinder. The second is the front fork. I never heard of a trussed girder fork collapsing from fatigue of the metal; but after 50,000 miles I might elect to fit a new fork complete. Treated on these lines, the life of a first-class motor cycle is not to be reckoned in terms of mileage or years: it approaches the infinite. The vulgar notion that a machine becomes unsafe or excessively troublesome after two or three seasons is a fallacy. This fallacy is based partly on the extremely careless and amateur fashion in which many riders "maintain" their mounts, and partly on the fact that motor cyclists are a mildly moneyed class, able to indulge a flirtatious zest for mechanical novelties. Thus my postman friend can certainly save money out of his 32s. allowance, if he is man enough in 1922 to resist the temptation to buy a new season model fitted with a six-stroke rotary engine or a petrol turbine.

So Simple.

I HAVE neither seen nor tried the Ashton-Evans carette, but it is certainly a logical "break" in cycle cars. Low price does not admit of a four-wheeled chassis with a differential axle, so some designers omit a wheel, thus rendering the odd remaining wheel somewhat inaccessible: whilst others retain four wheels and fit a solid rear axle, against which the public nourish a real, if groundless, prejudice. The Ashton-Evans engineers retain four wheels, and use a solid rear axle only 8in. between hub centres. This certainly seems to be the best compromise yet evolved. I am naturally eager to try out this system on the road, and wonder that nobody has adopted it before. On the other hand, if the proposed selling price of £200 materialises, the newcomer must fight some formidable adversaries, for it is in the same cost line as the A.B.C. and Cosmos, which are conventional four-wheeled chassis. The real opportunity for the new type of frame is as a rival of the Morgan and A.C. Runabouts; with a simpler specification it need not exceed their costs by more than £5—a sum which many people would pay to secure the advantages of twin driving tyres and accessible back wheels.

THE IDEAL LIGHTWEIGHT—WHEN?

A Twenty-year Old Problem. Will the Scooter hasten the Arrival of the Genuine Lightweight? A Triangular Contest now Commencing.

PROPHETS have never tired of reiterating during the past twenty years that the only possible motor cycle of the future is the lightweight. Very probably they are correct, but in the meantime the mediumweight and the heavy-weight types of machine are enjoying much well-deserved popularity, and it must cause impatience to those who years ago gave up the motor bicycle because it was "too heavy and cumbersome" to observe the delay in the advent of the genuine miniature fool-proof machine. The ultra lightweight, which shall be entirely dependable, capable of going anywhere, and marketed at a reasonably low figure, must undoubtedly form the "mount for the million" when general developments enable such a type of machine to be marketed in quantities.

The Ambitious Specification of "The Million."

As a scribe who for more than fifteen years has been told time and again that anyone who pinned his faith to the heavy and powerful machine was on unsafe ground, I marvel greatly at the tardy arrival of the reliable miniature answering the pedal cyclist's requirements. But let it be emphasised that the specification laid down for the "ideal" is certainly ambitious. We are told that its mechanism must be entirely enclosed, the machine must be mud and weatherproof, it must have an open frame so that one may ride it with ordinary everyday apparel without getting soiled, it must climb any hill, require no exertion in starting, and finally be cheap to run and cheap to buy.

Very nice, too! the reader will remark, and a really attractive mount when it does arrive. How far are we removed from this ideal? *Not very far*—in the writer's judgment.

A Triangular Contest.

Hitherto attempts to satisfy the huge army awaiting such a mount have been by (1) motor-assisted bicycles,

and (2) miniature examples of accepted designs of powerful machines. Now, however, a third competitor has entered the arena and seeks to attract the million. I refer to the motor scooter, but not the type with a "stand up" seat, which must take a back seat, to use a metaphor. Among the huge potential army of converts there are many elderly riders not to be attracted by a motor-propelled platform. A comfortable pan seat they must have! I have in mind the scooter embodying the best features of motor cycle design, but developed until the name scooter would discredit it, but nevertheless deserving of the term "miniature motor cycle."

Not a Mechanical Toy.

Any form of expensive toy enjoys but an ephemeral life; the original scooters are too limited in their range of action. The class of buyer to whom I refer as "on the brink" requires a mount that can be used for occasional touring, and not mere shopping expeditions. This type of motor cycle I firmly believe to be possible, and in the immediate future at a weight of 60 to 70 lb. Development in engine efficiency has rendered a tea cup-sized engine capable of serious hill-climbing with a fairly low gear. Since the war, the scientific value of the correct application of light alloys has become more generally and far better understood, so that we now await with confidence the enterprising manufacturer who will take advantage of modern developments, step in, and fill the breach. *Lightweights of 70 lb. or less, and costing under £30, we must have, for the thousands who annually find pedalling too laborious.* The triangular contest now commencing between manufacturers of (1) motor-propelled bicycles, (2) motor scooters, and (3) lightweight motor cycles at present weighing about 130 lb. must result, sooner or later, in the production of the miniature motor cycle for the million such as I have outlined. Which will win public favour in 1920? G.S.

The 90 lb. lightweight Wolf of 1909, a machine marketed at nineteen guineas, with a four-stroke engine having an outside flywheel.

The lady's model pacer, an ultra lightweight little more than a bicycle, fitted with a J.E.S. auxiliary engine, and weighing about 70 lb.

NO AGE LIMIT.

The Motor Cycle as a Suitable Mount for the Man of Mature Years.

TWO weeks ago we raised the query "Who is the oldest motor cyclist?" and in response to our invitation for these young-old readers to send us their experiences we have received many letters which endorse our opinion that there is no age limit where the motor cyclist is concerned.

Among these letters there are several from readers who are a mere fifty-five to sixty years of age. The average man may be "of mature years" at this age, but these motor cyclists are boys compared with their brothers of seventy and over.

Up to the time of writing, the oldest motor cyclists to our knowledge are two clergymen—the Rev. Edward W. Wilmott, Vicar of Cornish Hill End, Braintree, Essex, who is nearly seventy-two, and an Irish Canon, who prefers to remain anonymous, who is also in his seventy-second year. Mr. Wilmott writes:

"As a regular reader of *The Motor Cycle*, I am interested to hear that you are curious to know something about the ages of the 'old brigade.'

"Well, I bought my first cycle in 1867, and trundled it many a mile with its wooden spokes, wooden rims, and iron band. Of course, in time I took to pneumatics and multiple gears, and then when Sunbeams came, with the little oil bath, I transferred my allegiance to them, and have remained loyal to them to the present day.

"My present parish is in the depth of the country, miles from a railway station or market town, and so five years ago I turned my attention to motoring, and got a Sunbeam sidecar outfit. I began with a 2½ h.p., but though that might do for town work, I found it was of no use for the country and so changed it for a 3½ h.p.,

which, I find, gives ample power for all my work, while the sidecar provides for all passenger, station, parcels, or goods requirements.

"The Sunbeam cycle is still in daily use, though I do not, as a rule, use it for distances over fifty miles, but for business purposes and saving of time the motor is essential.

"If God spares me to live another three months I shall then be seventy-two, and every year increases my power of enjoyment."

A 72-year-old Sidecarist.

The letter from our Irish correspondent, who is another single-cylinder sidecar enthusiast, is given below:

"I am well into my seventy-second year, and by no means of strong physique or in vigorous health, and for the past six years have been riding a 4 h.p. Triumph with sidecar. I find it invaluable in my professional work as rector of a large country parish, and a constant source of enjoyment, as well as a means of health.

"My early experiences were a bit exciting, which is not to be wondered at when for a week or more I did not know that the way to stop quickly was to raise the lever handle of the exhaust valve, and my ignorance led me to charge straight into a wall at a fair speed, and I had besides a few mishaps at left-handed turnings too quickly taken, but such drawbacks soon became things of the past.

"As to cars, a friend of mine bought a large five-seater when he was about seventy-five, and declared his intention of driving it himself, to the dismay of his family and friends,

and on his first attempt overturned the car in the ditch. He had been a yachtsman in his early days, and gave this as his explanation of the accident: 'When I found myself with the wheel between my knees I thought I was on board the old yacht, and as I wanted the thing to go port so I turned the wheel starboard.'

"This, I fancy, must have happened in the history of motoring with others who, like my friend, had followed the ways of the sea in their youth. With him it led to his being content to rest upon the laurels as a steersman which he had gained afloat, leaving the guidance of a car for the future to the chauffeur."

Another reader over seventy years of age is Mr. John R. Marsh, of Wigton, Cumberland, who writes:

"I saw in a recent issue of *The Motor Cycle*, of which I am a regular subscriber, under the heading 'The Oldest Motor Cyclist,' you invite old cyclists to write to you.

"I am over seventy and commenced riding a motor cycle fourteen years ago. My first mount was a 2 h.p. Humber, and I am finishing with a 2½ h.p. Levis—a gem of a motor cycle, which carries me anywhere. Between them, I have ridden a 3½ h.p. Triumph (belt drive, single gear) and a 4½ h.p. B.S.A. and sidecar on which I have several times ridden from Wigton to Newark in the day. I still hope to enjoy many years of motor cycling. I ride to and from business most days."

A sixty-seven year-old reader, Mr. W. Croke, writes from Edinburgh:

"I am now in my sixty-seventh year, and at present drive a 3½ h.p. Rover combination, which I find exceptionally easy to handle and very economical, as I get from eighty to ninety miles to the gallon of petrol. I commenced motor cycling in 1902 with a 2½ h.p. F.N. with flat belt drive. Since then I have had various makes, including Humber, V.S., and Enfield.

"It may interest some of your readers to know that I started my cycling career in 1874 on a boneshaker."

Mr. W. Croke (age 67) on his 3½ h.p. Rover outfit.

The Rev. E. W. Wilmott (age 72).

Mr. J. R. Marsh (age 70).

The Youthful Motor Cyclist.

WHY THE MOTOR CYCLE APPEALS TO THE YOUNG MAN.

THE reason for my intense desire to possess a motor cycle from the earliest days was always somewhat obscure. When the young school-boy sees a reckless driver swerving round a blind corner at a dangerous angle, he is always impressed, and at once feels the desire to be the proud possessor of one of these machines. The sporting instinct that is latent in every boy comes to the surface, and reveals itself in the wish to accomplish something that appears not only dangerous and exciting, but a feat that will attract attention and surprise the onlooker. It is this sense of daring publicity that at first unconsciously appeals to the juvenile rider.

Initiation.

My first machine was a $3\frac{1}{2}$ h.p. Rudge-Multi. The neatness of this machine, however, did not satisfy me, and my chief desire was to transform it immediately into a noisy, racy-looking mount, regardless of the makers' design. The exhaust pipe was naturally one of the first things to be removed, and a large copper one was fitted. The exterior appearance, noise, and style of the machine are not all-important, but it gives considerable pleasure to the young motor cyclist to lean dangerously over the back of the machine and hear the roar from a carefully-constructed exhaust pipe.

To make quite certain that the exhaust was satisfactory I employed some boy friends, with large ears, who congregated at the appointed spot on the chosen route, to carry out the noise test.

A sense of lordly predominance crept over me, and as I approached the excited faces with ears strained to catch the growing roar of my exhaust, I carefully affected the correct racing attitude as I dashed by, to return a hero, and receive the glowing praises from my little group of admirers. Many of these tests were carried out until it was unanimously agreed that the noise was perfect and would surpass that of any other machine in the neighbourhood.

Long-distance touring never appeals very much to me. Preparing a route to arrive at a pre-arranged destination and return by another way is devoid of excitement. I maintain that a machine can be more instructively appreciated when the road work constitutes a form of test upon some new adjustment or

improvement that has been fitted. There are, however, conditions under which touring can be made quite enjoyable: by the addition of a cushion strapped on to the carrier of the machine, and the customary flapper seated thereon. The details of the best means of successfully arranging these excursions are, however, much too complex to explain, and should be left to the ingenuity of the individual.

A small workshop is desirable, sufficiently equipped to enable the rider to effect any small repair or adjustment. The greatest fun can be found by continually adjusting the tappets, the magneto, and valve timing gear, and fitting different sized jets, experimenting with various mixtures of fuels, and carburetter adjustments, such as a home-made design of induction pipe, air intake, and carburetter heating device. Very little machinery is necessary: a small Drummond lathe, a vice, and set of useful tools, are quite sufficient to tune up or rebush any part of the machine. A motor cycle is never perfect in the eyes of us youngsters, and the wet and dull days can be spent in a very instructive and interesting way by experimenting with any of these fittings. The sporting machine offers a very wide scope for indoor amusement; and, when the next suitable day arrives for outdoor riding, there is always something engrossingly new to be tested, which not only affords constant amusement, but prepares the machine for the forthcoming trials for which the enthusiast will enter.

Another of the many reasons why I like the motor cycle is the fascination of speed trials and hill-climbs, and I think that one of the best conditions under which a speed trial can be carried out is on a wide stretch of sand. Although the small disadvantage created by the fine dry sand entering the exposed parts of the machine is annoying, sand offers a good surface for speed tests, especially if it is slightly damp.

Exciting Competitions.

During the summer months I spent many happy week-ends at a seaside resort on the West coast, where a five-mile track of sand, damped by the ebbing tide, was popularly attended by enthusiastic motor cyclists; and after a pleasant run from my home, about thirty miles distant, an impromptu race on the sands, with an equally powered machine, combined with the attractive scenery of the pleasure resort, formed a most exhilarating recreation. The pastime, in my opinion, would be very dull were it not for competitions and hill-climbs, which are usually very amusing. A considerable amount of practice is required to compete with professional riders, but the practice that is necessary affords some exciting and enjoyable hours.

The Youthful Motor Cyclist.—

I have found that much amusement can be obtained by what might be termed "scientific" riding. Considerable skill is required to take, successfully, a sharp bend in the road at sufficient speed to reach the standard required in speed trials or hill-climbs, and a most enjoyable hour or so can be spent by practising this difficult task. A corner having a soft grassy bank on the near side is the most suitable, and much more comfortable, as the inexperienced rider is bound to have a number of falls, resulting from bad judgment of the angle at which he can ride his machine.

The centre of gravity of the machine should be as low as possible to hold the tyres to the road. This,

however, can be considerably aided by the riding position affected by the driver. Thoroughly to enjoy the qualities of a machine of this type, all superfluous fittings and gadgets should be removed. A speedometer, throttle, and ignition controls only, should adorn the low T.T. handle-bars which are essential to allow the rider's body to form, as near as possible, a stream-line or anti-wind resistance position.

The pastime under these conditions is both inexpensive and enjoyable, and the proud owner of an efficient motor cycle of this kind always has the satisfaction of knowing that his machine is in the best possible state of repair and capable of doing any kind of work at any time. B.

SUMMER DAYS AMID THE SAND DUNES.

No summer would, of course, be complete without a holiday by the sea, and no holiday complete without those delightful picnics with the "old 'bus" to assist in finding the ideal spot.

The Picnic-Basket and the Sidecar.

Hints and Tips
as to its
Contents and
Accommoda-
tion.

A Useful
Guide
to Motor
Cycling
Picnic Parties.

THE picnic basket has now become an almost essential part of the sidecar equipment, and it would not be surprising if designers of 1920 machines more seriously consider the question of its accommodation. Provision is usually made to carry a petrol tin. There are two pannier bags and a locker under the passenger's seat for tools and spares, which we rarely use, and many sidecars have a grid to carry luggage; but, so far, the picnic basket has not entered into the accommodation plans of the sidecar.

(Left) The Primus portable spirit stove. (Centre) A similar type—the Radius. (Right) A convenient lighter, which boils half-pint of water and costs 10½d. per dozen.

Naturally, to those who have luggage grids which are supported by the springs and not on the chassis itself, these means, unused excepting for tours, will be considered as suitable for carrying the picnic basket. Provided the basket is in a dustproof cover, the grid solves the problem; but such a cover must be dustproof, as the majority of picnic baskets are not. Even the cloth or leather outfit is not impervious to dust if placed in an exposed position: hence it is necessary to cover the picnic equipment if carried on the grid.

This cover may be a made-to-measure case of waterproof material, having a close-fitting "lid" completely enveloping the sides. Another means of protecting the contents from the dust is to wrap the basket in a waterproof sheet, which is useful as a ground sheet when picnicking after a shower of rain, or may be used as a canopy as illustrated above.

When a single passenger is carried in the sidecar, space for the picnic basket may be found on the floor of the car, but the average sidecar is not sufficiently large to do this without robbing the passenger of her or his comfort. If the equipment must be carried

in the sidecar, it will be found more convenient to split up the paraphernalia, the stove, kettle, and cans being packed in the tool lockers, the plates, etc., in a strong leather case, and the eatables in small biscuit tins which can be distributed on the floor of the sidecar. This, at the best, is only a make-shift arrangement for the motor cyclist who has not a sprung grid.

A Miniature Pantry.

Since the majority of motor cyclists who picnic are family men and, in addition to their wives, take their children along on their jaunts, the equipment required increases as the spare space decreases; thus, with the family sidecar, a sprung grid is a real necessity, unless the designer of the sidecar has made proper provision for the picnic equipment within the body itself.

We recently saw a sidecar with a rear locker, which the owner had converted into a miniature pantry. The sidecar was of the type having a locker in the rear panel. The well of the locker was used to accommodate the stove, water, fuel, kettle, and tins for eatables, and the lid was equipped with a canvas envelope, in which were fixed knives, forks, spoons, and small "odds and ends." The top space of the locker was fitted with a detachable rack,

A small picnicking outfit marketed by Messrs. Brown Bros. which costs 35s.

The Picnic Basket and the Sidecar.—

built of three-ply wood with leather partitions for four plates, saucers, and cups, a teapot, and two screw-top glass bottles for milk.

The owner of this very complete outfit assured us that, although "china" plates, cups, and saucers

A small case for a vacuum flask and sandwich tin, costing 18/9, from Dunhills, suitable for solo riders.

were always used, he had not broken any of them during 2,000 miles of touring.

On this point, probably, the majority of motor cyclists will find enamel ware more suitable than "china," until makers fit up sidecars with a "miniature pantry at the rear" as mentioned above, but another alternative is

to use paper cups, etc., such as are sold by Selfridges. This paper ware is by no means expensive, as will be seen from the following list:

Cardboard cups 2s. 11d. and 3s. 11d. per doz.
Paper table cloths, 30×30in., 6d. each.
Cardboard plates with grease-proof lining: 9in. 1s. 2d. doz., 8in. 10½d. doz., 7in. 7½d. doz.
Salad dishes, 10×7in., 2s. doz.
Square dishes, 6½×5½in. 10d. doz., 7¼×6¼in., 1s. 1d. doz.
Creme paper serviettes 2s. 6d. per 100.

Picnic enthusiasts are divided when it comes to the question of cooking in the open. There are many who prefer the conveniences of the vacuum flask to the spirit stove or camp fire. The vacuum flask allows hot or cold liquids to be carried, and undoubtedly is a great convenience, but with a spirit stove a hot meal is quite practicable, and several meals may be partaken without replenishing the lockers.

All the same, vacuum flasks are extremely useful, even when a stove and kettle are carried.

Useful Details.

British-made Isola vacuum flasks sold by Dunhills and Gamages range in price from 10s. 6d. to 21s. 9d. for the pint size, and from 21s. 9d. to 41s. 6d. for the quart, according to the type of casing. The firm named also catalogues refills at —s. 9d. and 13s. 6d. respectively, while a leather case for the pint flask, with a sandwich case, is listed at 18s. 9d.

Several suitable spirit stoves are obtainable from such firms as Brown Brothers, Dunhills, Gamages, and Selfridges, of which the Primus probably leads on the point of popularity. This well-known heater may be obtained in a "pocket" size metal case (5½×4¾×2½in.), with a three-hours' burning capacity for 37s. 3d., while larger sets with an eight-hour capacity are 53s. 3d. and 66s. 9d.

A cheaper wickless stove, known as the Radius, is marketed by Gamages at 29s. 6d. This is col-

lapsible, and contained in a tin case measuring only 6½×5½×3¼in. Another model of the Radius, which is not portable, costs 27s. 9d.

To those who require something very much cheaper the "Rapid" cooker will be of interest. This is catalogued by Gamages, and takes the form of a self-contained lighter capable of boiling half a pint of water. Sold in boxes of twelve, complete with stand, the price is 10½d., and they should prove useful in any picnic equipment as an auxiliary cooking apparatus.

As regards complete picnic baskets, these are obtainable from all the firms mentioned above. Brown Brothers sell a very neat satchel, which will appeal more particularly to those who ride on single-track machines, either alone or with a passenger on the pillion. It is exceptionally neat and compact, and can be carried on the handle-bar or slung over the shoulder. The price is 35s., and the outfit is very light and compact, as will be seen from the illustration on the preceding page.

Compactness is a very important point concerning picnic baskets to be accommodated on the sidecar; therefore, to give some idea of average sizes, we give below a few dimensions and particulars as to contents, which may be a guide to those who are not yet equipped. For two persons, Gamages sell a tea basket containing kettle, with screw lid and spout, tea infuser, wind guard, lamp, and spirit container, wicker-covered milk bottle, tea and sugar canister, biscuit box, enamel cups (two each), saucers and plates, butter jar, knife, and two teaspoons. The size of this outfit is 12×9×7in., and the price 36s., while for four persons the size is 14×12½×7in., and the price 49s.

Prices and sizes vary according to equipment and make: therefore, when the space available is ascertained, it is advisable to obtain catalogues from one of the firms we have already mentioned, when a basket of the desired size, equipment, and price will, in all probability, be found.

Properly equipped for *al fresco* meals in the open, the motor cyclist is independent of restaurants, which at holiday times are generally overfull. In addition to its greater convenience, a picnic in some well-chosen spot and at some well-chosen moment enhances the pleasures of motor cycling to an extent little realised by those who do not travel "self-contained."

A useful size of picnic basket suitable for a sidecar. The size is 13×10×8, and it costs about 45s. from Dunhills and Selfridges.

A dustproof envelope covering a picnic basket on the sprung carrier of an A.J.S. sidecar.

Tendencies in Design.**More Consistent
Quality.****Sprung Frames.**

IT would hardly be an exaggeration to say that the motor cycle industry is in the melting pot, and that a year or two must elapse before anybody but a prophet can decide what the outcome will be. I am not thinking first or principally of the commercial aspects. Neither am I thinking of the price question, though eventually keen competition, followed by over-production, may result in at least a temporary cutting of profits, whether Ford flings his gauntlet into the arena or not. I refer specifically to the more technical features of the gigantic struggle which is slowly developing before our eyes. At least three novel types of machine are tilting against the old conventions. There is the motor scooter, which claims to supersede the standard machine for short distance utilitarian work. There is the simple four-wheeler, represented by the Grahame-White buckboard, and by at least two other quads which I wot of: these presumably cater for people who dislike the single track machine—do not crave for speed, and perhaps desire more protection.

A Big Fight Ahead.

Then the new Douglas and the A.B.C. suggest that the speedster and sidecar merchant can have their desires fulfilled at a revolutionary weight limit. In the face of these and other less sensational challenges, many of the older designers remain mute for the moment. They may have sensational retorts in preparation, or they may feel that such innovations contain no perils for the conventionalist school. All we can say is that up to the present some of our most experienced makers preserve a dignified calm: they continue to list and sell the type of 'bus which was familiar in 1914.

In this welter of projects and possibilities, there is only one certainty: a big fight is ahead. Within two years the issue will be clarified. At the moment nobody really knows whether the old school will come out on top, or whether the scooter, the monocar, the Ford cycle, and the fear-nothing mediumweight will revolutionise design and production.

This review of the uncertain factors can now merge into a consideration of items upon which no dispute is possible. First of these I should rank the subtleties of engine design. Beyond all question the motor cyclist's chief bugbear in the old days was distortion. Most 1919 engines preserve their truth after ten miles of full throttle: so they need less oil, they carbonise less rapidly, and they maintain their tune longer. Whatever size or type of engine may be established in our favour by 1920, we may reckon on its embodying these indicated improvements. It is obvious that the two-stroke and the bijou engine with little or no reserve power receive enhanced opportunities as a consequence.

**Automatic Carburettors
Mechanical Lubrication.
More Silent Machines.**

As the second certainty, I should select a vast advance in the average quality of the engines produced by a given firm. Once upon a time we all took it for granted that each batch of

one hundred engines emanating from a factory contained perhaps

- 1 star engine.
- 4 first-class engines.
- 92 common or garden engines.
- 3 duds.

The star engine was kept for the firm's trade riders; the first-class engines went to picked customers; and the duds punished the secret sins of various unfortunate buyers. By 1914 one or two leading factories had almost, though not quite, contrived to level up their output; but engineers whose names were household words could still regard the undulations of the test bench as a profound mystery. In sober fact the aberrations were a mere matter of sloppy workmanship. If you use .001 in. gauge you get excessive tolerances: a "maximum" shaft is fitted in a "minimum" bearing, and the resultant engine will not rev. But if your gauges narrow fits down to .001 in., your engines attain a dead level of excellence, and need no running in. Munition work has taught the less careful firms the value of closer workmanship, and the progress hardly adds a cent to the cost. The result is that the star engine has vanished out of the best factories: in a batch of 100 there are no divergences worth notice; when the works manager requires a "stunt" engine, he does not ask his testers to keep their eyes open; he just designs a few special parts.

The Universally Bad Roads.

The third certainty is better springing. It will be something of a disappointment. I have the luck to live in a district where cast iron pot-holes are unknown; good as my local roads are—so good that a rigid fork and frame were never intolerable—a fully sprung frame of sound design made motor cycling absolutely velvety in 1914: but to-day I bump a little. In 1914 I pitied the unfortunate resident who rode a rigid rear frame in a knobbly-road district, and thought how the advent of spring frames would impress him. Well, it would not. Our roads are now so universally bad that in 1914 an average road plus an average frame spelt much the same comfort as an average road and a good 1919 spring frame spell to-day. But there is this about it. With the vile roads which we now perforce accept, sprung frames are a sheer necessity. Incidentally, rear springing is an educator. It teaches its owner to identify and to loathe a bad front fork. In 1914 we blamed the back wheel for the shocks and vibrations from which our tender bodies suffered. In 1919 we can track some of these miseries to their true home—viz., a dud spring fork. We must wait a year or two before we can hope for perfectly sprung light-

Design in 1919.—

weights: existing springing designs are mostly on the heavy side.

In all probability the three improvements detailed above will be common to all the new stuff. It remains to consider items of less universal application. Of these I hope that electric lighting for solo machines will be the top spot. The perfect acetylene generator has not yet been invented; all existing types hold small charges and are messy to clean. Give us a spill-proof battery, which is not too big and will not buckle under heavy discharges, and our lighting troubles will be over. Suitable dynamos and lamps abound; I believe this year will bring some of the right batteries along.

Every practised rider knows how mounts vary in respect of steering. I have driven a Triumph hands off at 45 m.p.h.; I have owned other machines which wanted manhandling round every corner, and wobbled fearsomely at speed. This year I have already tested two or three machines which seemed almost to steer themselves.

Transmission Troubles.

Transmissions vary enormously. One make may have a rough drive, rattlesome chain cases which take hours to remove and replace, a clutch which either would not come out or would not grip, a chain adjustment which entails resetting the clutch and gear controls, inaccessible gear box hangers and lubricating plugs, and other defects. Others run as smoothly as a billiard ball on well worn nap. These variations are slowly being levelled up.

I know there are two opinions about automatic carburetters, but I fancy so many riders want them that all makers will soon fit them as options, if not as standard. The flowmeter method of gauging jets will average up carburettor settings, and the old anomaly under which machine No. 1,012 gave 85 m.p.g. and machine No. 1,013 gave 100 m.p.g. is doomed. I cannot help thinking that aero engines will beget light motor cycle carburetters as soon as aluminium grows more plentiful again. We need no longer buy 100 yards of insulating tape with each new machine, for induction unions are receiving very necessary attention.

Lubrication is a thorny point to tackle when current practice differs so enormously. It ranges from the hand pump with its boa constrictor gorges at the rider's discretion, to the out-of-sight, out-of-mind systems which merely require replenishing with a gallon every eight weeks. When doctors differ, an amateur must tread warily. It is undeniable that one or two designers scrapped the drip feed after lengthy trials because they found that the heavily-loaded bearings did not wear so well when subjected to a steady oil feed at a low rate, and

deprived of the periodic cold bath of fresh oil. But the position has changed. At the time when several firms scrapped the drip feed, phosphor bronze bushes were the rule; given perfect workmanship, this type of bush wants a lot of oil, and many factories used to rely perforce on second class labour, whilst their methods were not of the most accurate. To-day we have better methods, more skilled labour, and phosphor bronze bushes are yielding to ball and roller races which demand far less oil. As a personal opinion, the sump and submerged pump type of lubrication will make good; we have long sighed to get rid of the monotonous responsibility of operating a hand pump, a system which disappeared from cars fifteen years ago. Perhaps the time has come at last; if so, it means pleasanter jaunts, a cleaner tank top, and more petrol capacity. Talking of tanks, the leakproof petrol tap is here, and also the three-way tap, which keeps a pint or so of fuel as an emergency reserve.

Future Tendencies.

The show will tell us whether machines are growing more cleanly and more cleanable—two quite distinct points. There is an obvious tendency to fit under-shields, and a few designs include furlable screens for keeping off the mud flung up by the front wheel. These gadgets are advantageous, but do not go far enough. If the power unit above and behind these screens resembles a heap of spillikins, the machine may be cleanly, but is not cleanable. The ideal surely is that if the front wheel and forks of a motor cycle are removed, the breastbone of the remaining portion should resemble the bows of a boat, and that the mechanism inside the "keel" should be guarded against mud, rain-rust, and dust by light aluminium panels or other defences. We have not got as far as this; the new designs are cleanly, but the devices which make for cleanliness often render the machine less cleanable. Still, it is something to be able to ride a quarter of a mile in trousers without getting thoroughly bemired.

The word "clean" is also used metaphorically to denote shapely lines and a smooth exterior. In this section there is nothing to report. Handle-bars are still nickelled *chevaux de frise*; the hooter and the speedometer dial continue to upset the steering balance. Festoons of external control wires, sparsely confined

by pinch-on clips, decorate the steering head as gaily as ever. Tanks are getting cleaned up a little, but many are still as hard to dust as a bent iron girandole or silver filigree. Crank cases ditto, as a rule, with a few blessed exceptions. The bottom bracket region remains a filth trap.

The perfect motor cycle wheel is still uninvented. The old Olympic standard of a plated hub, plated

CRESTING THE HILL.

Interest is always displayed by owners in the climbing capacity of other machines.

Design in 1919.—

spokes, plated rim, with a red, green, or blue decoration, is still paramount. But crawly progress is evident in flirtations with discs, in black hubs, detachable wheels, first-class stands at front and rear, some provision for coaxing a released wheel in and out of place, better chain cases, brakes which do not seriously interfere with tyre repairs, and other minor advances. It should be noted that for sidecar work a big tyre run rather soft is a splendid insulator; of course, on solo mounts a big tyre must be inflated pretty hard to prevent "roll."

Main Features of Interest.

On the broad question of silence our world is as sharply divided as Sinn Fein and Ulster. But one forward step should be chronicled. In former days, the man who loved a crisp, penetrating bark could make a dual defence. On the one hand, it might be alleged that a silent machine is apt to be dangerous; on the other, that he preferred the smack of hot gases

on the startled air to an orchestra of squeaks and rattles and whirs. The *ensemble* of mechanical noises emitted by the modern machine is being hushed. Valves, timing gears, transmission, springing details, and minor fittings are being quietened. The day is coming when the mechanism of the motor cycle will be quite reasonably quiet, and the matter of silencing the exhaust can then be discussed on its own merits.

To sum up the position, my eye picks out three main features of interest:

(i.) A marked and universal improvement in engines, divisible into higher efficiency and greater maintenance of tune.

(ii.) A pending struggle between old types and newcomers.

(iii.) A widespread attention to the perfecting of every conceivable detail.

The next show and the next year thus promise to be quite the most interesting in the history of the motor cycle world.

B. H. DAVIES.

A COMBINED TRIAL AND TOUR.

A Competition designed to Encourage New Members of the Bristol M.C.C.

THE members of the Bristol Motor Cycle Club were favoured with delightful weather for their opening trial and tour to Land's End. Out of 20 entrants 14 faced the starter, which, considering that the majority were new members, was considered exceedingly satisfactory. The Trials Committee framed the conditions with a view of making the event more of the social rather than competitive order. A number of non-competing members of the club followed the trial throughout.

Several new models were in evidence, notably the 6 h.p. Douglas shown on page 625, a 3½ h.p. chain-driven Norton, a 1919 Sunbeam, and a 1919 model W.D. 2¾ h.p. Douglas. The former machine from the Douglas works is an attractive looking outfit.

The new model Norton in the hands of A. W. Walker was also a much admired machine.

The following competitors completed the course to schedule time and secured gold medals:

W. J. Wotton (3¼ Sunbeam).
G. S. Gerrish (6 Enfield sc.).
H. N. Walker (3¼ Norton).
Eli Clark (4 Douglas sc.).
D. W. Dyer (4 Douglas sc.).

W. Thornhill (2¾ Douglas).
H. Thorpe (2¾ Douglas).
W. W. Moore (6 Douglas sc.).
R. W. Oliver (7 Indian sc.).
I. L. R. Large (2¾ New Imperial).

W. Thornhill and his 1919 2¾ h.p. Douglas starting in the Bristol-Land's End trial. Thornhill was a competitor in the 1914 T.T.

The Motor Cyclists' Parliament.

First A.C.U. Committee Meeting in the Provinces. A Great Meet of Motor Cyclists Expected at the Bristol Rally.

THE first General Committee meeting of the A.C.U. to be held in the provinces will take place on Friday, the 20th inst., at Bristol, and it is anticipated that the western City will do everything to make the visit of the Committee a pleasant one. The Committee now consists of representatives of the sport and pastime from many districts, and the meeting will be one of more than usual interest on this account.

Great efforts are being made by the Bristol M.C.C. to organise a "big Bristol meet" of motor cyclists

for the following day. As already reported, Ashton Court Park has been loaned by Lady Smythe, a good orchestra has been engaged, and a souvenir hand book is in preparation. As many new and "advance" models will be on view, it is expected that a large majority of West of England riders and others will be present.

If the interest in even ordinary machines displayed by the public is any criterion, the Bristol Big Meet will be a success.

SOME OF THE NEW MODELS IN THE LONDON-EDINBURGH RUN.

(1) 5 h.p. Brough. (2) 3 h.p. A.B.C. (3) 2½ h.p. Clyno. (4) The new spring frame 8 h.p. Chater-Lea. (5) A spring frame lightweight—the Hobart. (6) A 3½ h.p. spring frame Douglas. (7) The flat twin Wooler. (8) The new "Model 77"—Rex single. (9) One of the new 8 h.p. Clynos. (10) An 8 h.p. spring frame Matchless.

WHERE TO GO FOR A TOUR.

Places of Interest and Beauty in
many Counties easy of Access
to the Motor Cyclist.

A FAMOUS YORKSHIRE CENTRE.

NOT many districts provide the variety of scenery of Upper Wharfedale, the land beloved by Leeds and Bradford motorists, basking as it does in an atmosphere of old-world quietude, yet so easily accessible from a host of crowded centres. The coming of the tourist has not spoilt this land, endowed by nature with beauties she has used as sparingly as gold elsewhere, for here, from the valley heights, we have the miles of dead level moorland road—dead hard, dead straight, and dead deserted, where the writer has sorely tried the speed capabilities of many a worthy mount for discussion in these pages. Try,

for example, Penny Pot Lane, near Blubberhouses, or, leaving Otley, ignore the main valley road, and, passing over Otley Bridge, take the road to Blubberhouses, round two awkward corners, and on to Greenhow, then sharp to the left, striking Appletreewick or Hebden as you choose. If time is no object do not miss Bolton Abbey Woods. They are the very essence of Wharfedale, and a striking contrast to the bleak, windswept lands already traversed. The woods and the river together form a combination difficult to equal, while the ancient abbey offers rare opportunities for the photographer. The Strid is, of course, famous. Here the entire waters of the well-known trout river are crushed into a space over which the rash youths attempt to leap. It is a fairly easy jump, but hardly worth it for the sake of the thing, as a false step means certain death by drowning. Just below the rapid under-currents of tremendous strength exist, and the unhappy tourist who makes that false step is probably never seen again till he appears at the end of a grappling iron, many hours later.

Appletreewick is a picturesque little village, favoured much by anglers. The trout fishing in the Wharfe is good, but very strictly reserved. Day tickets for fly-fishing only can be obtained at any of the fishermen's inns for 5s., which after all is not an expensive day as sport and pastime go. At Appletreewick, I believe, the fishing goes with the inn.

A WHARFEDALE TROUT STREAM.

The motor cycle enables one to get to most inaccessible spots in this wild but delightful district.

Where to Go for a Tour.—

Burnsall is perhaps the peach of Upper Wharfedale villages, and is blessed with two very good hotels.

When the writer first knew Burnsall, close upon twenty years ago, it was indeed a village of rest, and surely here there lived a generation of poets? The road running up the hillside, which we descend if we miss Appletreewick and come by the Barden Tower side, was clothed in those days with grass about its centre, so few and far between were passing vehicles.

One of the Sunday evening events of Burnsall is—or used to be, especially about T.T. time—the arrival and departure of the Scott team on their hot-stuff mounts. They sure were some 'buses in the pre-war days, and many other owners of sporting machines usually put in an appearance.

Burnsall village school is rather a picture, set in its own small garden, the condition of which bears testimony to the undying patience which breathes into each fresh generation of juvenile scholars a pride in their seat of learning. The school is associated with the name of Eugene Aram, once a master there, and who finished his morbid career, like Dr. Crippen, "with gyves upon his wrist."

Ancient Pack Roads.

Higher up the valley, Kilnsey, with its overhanging crag, is worthy of note, for we have now gained a country of quite a different nature, the green, well-wooded valley having given way to limestone uplands, rising plateau upon plateau, wind-swept and picturesque. Nevertheless, this land of shallow soil is, in the spring of the year, a miniature Tyrol, and the many streams and ancient pack roads offer fascinating opportunities for exploration. The pack roads are a special feature of this country. Usually they are dead

straight, independent of all gradients, and by them the old-time packmen used to pass from place to place hawking their wares.

Wharfedale is not sparing in what are known as "freak" hills. Journey to Kettlewell and try Park Rash—quite a moderate little pimple which calls for judgment in riding. Or bicycle over the watershed *via* Greenhow and explore the Nidd Valley—one of those closed-in little valleys that have a charm quite of their own, with freak gradients everywhere as soon as the main route is left. A real freak route is from Kettlewell, *via* Park Rash, to Arkleside; then across the Nidd and up Wooddale Scar to Middlesmoor and Ramsgill, where there is another excellent hotel.

Passing out at the headwaters of Wharfedale, one goes by Kidstone Pass and down again at Aysgarth, whence one is *en route* for Sedbergh and the Cumbrian Lakes, through gorgeous moorland country.

To see this land at its best the stereotyped main road tour should be avoided. The by-ways are infinitely the more beautiful and interesting, and usually afford better travelling. Those who care to ramble and put up where the night finds them could not find a happier hunting ground. CHINOOK.

SURREY COMMONS.

IT would be hard to find a pleasanter locality than Surrey for a holiday of the less strenuous kind.

The Commons, which are so common (no pun intended) in that county, are ideal spots in which to while away a few hours of leisure. The Commons are dotted with delightful ponds, many of them artificial, but none the less charming on that account. All London motor cyclists know Wisley Mere and the

Hut Hotel; but if the Ripley Road be followed a little further, many another equally charming place will be reached. In the district south-west of Godalming a prettily situated little town, lying between

(Right) At the top of Red Hill near Wisley Hut.

Where to Go for a Tour.—

hills, and overlooked by Charterhouse School, but with a bad reputation respecting motorists, the Commons extend for mile after mile. The Portsmouth Road can be left at Milford, and a lane leading to Elstead taken. Passing the gates of Peper Harow, the residence of Viscount Middleton, the rider reaches Royal Common, where beeches, birches, bracken, and oaks are plentiful. (Many Surrey commons are covered with firs and heather only.) Here a turn to the right takes him over Somerset Bridge. A turn to the left, and a narrow but pretty lane, and one reaches Cutt Mill, where a series of ponds extends past Hampton Lodge on the edge of Puttenham Common, whence it is a delightful run to Crooksbury. There was some talk a while ago of cutting down the firs on Crooksbury Hill, near Waverley Abbey, but it is to be hoped that they will long be spared.

Frensham, noted for its ponds, lies not far from here, and is well worth a visit. Frensham Great Pond lies close to the road, but the smaller pond—also of considerable size—is not so easily found. At Frensham there is a beautiful old house called Pierrepont House; here, too, it was that hundreds of motor machine gun men recruited by *The Motor Cycle* received part of their training.

After leaving Frensham it is well worth while to visit the Devil's Jumps, a series of rounded hills on

IN THE LOWLANDS OF SCOTLAND.

old man was lying. The sailor's grave is in Thursley churchyard, a few miles away.

From Hindhead there is a descent of about three miles on to Witley Common, another place where ponds abound. The finest of these is known as the Forked Pond, and lies some way from the road over a sandy track. A couple of miles further on Milford is again reached, and the little tour of commons and ponds completed.

AURIGA.

THE LAND OF BURNS—A REGION UNSPOILT BY THE TRIPPER.

THOUGH somewhat remote, from the point of view of most English motorists, the South-west corner of Scotland, frequently known as the land of Burns, is so rich in scenic beauty—from panoramas of pine-capped ridges with mountain torrents gushing between, to the wide, wild, desolate mountain uplands—that it fully repays those who care to venture so far afield.

This region is of note, in that, while being truly Scottish, it is far less inaccessible than the Highlands—indeed, from Carlisle it lies open at our feet, over good hard roads for the most part, except that certain stretches over which lumber has been transported have lost their pristine smoothness of surface.

From Carlisle let us head straight for Dumfries, the town of the immortal but ill-starred bard for whom Scotland had no place while he lived, and has bemoaned it ever since. Here flows the River Nith, to which Burns so often alludes—alas, that he was not content to confine all his tastes to its charms!—and his admirers who care to dally for a while will find many scenes to reawaken the poet's charms.

From Dumfries we have a choice of roads. Perhaps the most tempting for the moment lies in the direction of Castle Douglas. The main road can be left at Crocketford, and the road to the right taken. After two or three miles of appallingly bad surface, we now have a gorgeous moorland spin, through country swarming with black game and roe deer, to New Galloway.

(Top) Lochside, a famous angling resort on Loch Ken.

(Bottom) A typical Scottish Lowland landscape. The sidecar outfit in the foreground is a Scott.

the way to Hindhead, and the Devil's Punch Bowl. The stone, which is supposed to mark the place where the famous—or infamous—murder of a sailor took place, stands by the roadside here. When I was a boy I remember an old farm labourer saying that he had a holiday to see the murderer hung on Gibbet Hill above the roadway, but I fancy that the

Where to Go for a Tour.—

Probably the English motorist in this country will be surprised at the immense distances between towns and villages. It is not uncommon, indeed, to travel for miles with no near glimpse of human habitation, but one very soon becomes used to this state of affairs.

But we have pretty villages, scores of them—rows of white-walled cottages nestling beside silver burns, where the hart's tongue and wild garlic shine forth amidst a chaos of discarded fruit trees and retired buckets—cottages on lonely mountain heights, rugged as their surroundings, with rows of shining buckets set out to sweeten, and incidentally to afford perching places for the usual motley throng of hens, most remarkable for the scantiness of their plumage. No wonder it is scanty, for here the very heather hangs low and knotted to battle with the gale. It is a living, devilish, palpable thing, that gale, which blows the very wool off the backs of the mountain sheep, and leaves only the fittest, in man and beast, to survive.

Scottish Natural Beauty.

Galloway town, with its straight main street, is nothing to fall over one's self about in the way of picturesqueness, but it is situated in the midst of wonderful country. Scotland is so rich in natural beauties that her children, past and present, have been mighty canny as regards any addition in the way of architectural charm. If by chance or design an incongruous house or an ugly bridge is erected in Scotland, Nature, using here with a liberal hand her choicest craft, hurries the house in a bower of blossoms, or covers the bridge with a tapestry of ferns.

No one, however, would go to Galloway in order to sit in the main street, and the tiny town is blessed with two good hotels, which is more to the point. It is needless to add that fishing is abundant everywhere in this country; brook and loch, trout fishing can generally be obtained by the simple medium of a little courtesy, while most of the lowland lochs are fairly alive with pike and perch, both excellent eating.

We are now in the towering kells, and the road on to Newton Stewart is a real highland road, passing

through a region still the stronghold of a noble race of mountain birds, many of which long ago gave up the unequal struggle for existence in less secluded parts.

The shepherds of this region live appallingly lonely lives, scarcely seeing a fellow creature save on their occasional and infrequent trips to town. They are quiet-voiced, kindly men possessing a fund of information about their own locality which they are ready to pass on to the visitor, as this land is not yet spoilt by trippers.

From Newton Stewart, we can make for the coast at Girvan, or, if the mountains be preferred to the sea, take the inland road which follows the Minnock Water, passing at the foot of Merrick, which rises to a height of 2,764 feet, thence on to Ayr.

The Home Trail.

Biggar is our next goal, and, whichever road we take, the scenery is charming and wonderfully varied. Reaching Biggar, we are soon in the Tweed Valley heading for Peebles. Of course, the road surfaces are assorted, but the same applies everywhere, and for the most part they are better than the average English road.

Peebles is a rolling upland country of boulder-strewn moorland and pine woods, and the valley is very beautiful; the land of another immortal—no other than Sir Walter Scott. Melrose, with its picturesque abbey and romantic river scenery, should not be missed, and we are now well *en route* to return homewards by the east of England.

I can imagine no more delightful tour than one which, passing northwards by Derbyshire, the Dales, and the Cumberland lakes, takes into its compass this part of Scotland on the lines suggested, finally following the valley of the Tweed back to the eastern boundary.

Such a tour would embrace a great variety of scenery. The Derbyshire hills have a distinction of their own, and the visit to the English Lakes would recompense one for the omission of the Scottish lochs from the tour.

H.M.B.

**LONDON-EDINBURGH RUN**

(Left) F. T. Bidlake checking Lt. G. P. Glen Kidston, R.N. (3½ h.p. Sunbeam), at the finish of the trial
(Right) J. A. Masters (7 h.p. Harley-Davidson) signing the checking sheet at the finish

WHAT a charm the open road has can only be fully realised by those who have tasted its joys.

In this short article I hope to give some hints to readers on the way to make the most of their lives: to enjoy to the full the "open road": the moor, mountain, and stream: to appreciate our beautiful country. It is free to all who would partake of it: free as air and water. Think of it! The cure for a hundred ills is the open air. Here we have a private sanatorium, a holiday home, and a mobile dwelling place, the cost of which is saved in the first holiday, and which can be used for one night or for weeks on end. These are just a few of the many advantages of lightweight motor cycle camping.

The Outfit.

All one needs is a tent. I use a Canadian, with 18in. walls and 9in. eaves. It is 5ft. 9in. high, 6ft. wide, and 7ft. long, and weighs 5 lb. The poles are of bamboo, and take to pieces like a fishing-rod. It is better to use a fly sheet with the tent, which is a sort of double or extra roof, and has the advantages of keeping the tent cooler in summer and warmer in winter, being, in fact, like "Pat's" overcoat. Besides this, one can touch the sides of the tent when it is

straw bracken, or hay under the ground sheet. Cooking presents no difficulty with a Primus stove, using aluminium saucepans and frypans, which pack away in a small compass. Aluminium spoons and forks save weight; we used bags for sugar, tea, cereals, etc.; while aluminium screw boxes are used for butter and preserves. The Primus needs a windscreen, and it is an easy matter to improvise one usually. The water-bucket and wash-basin are of sail-cloth.

How to Sleep Comfortably.

With this outfit one can cook anything one likes, except bake; but that can be nearly approached by fry-steaming—that is, frying with a tight cover over the pan. I have never yet heard anyone who has visited me complain of the menus, although I often get doubting Thomases before they have tried it.

"But what about sleeping?" you say. This is the delightful part about the open air life. In August, 1918, I spent a fortnight sleeping on a small folding camp bed right out in the open most part of the time. Try it, and you will find town-jaded nerves clear like mist before the sun.

I sleep in the tent with my head towards the open end and my feet in the warm, and, after many experiments, I think I have found the solution of a real comfortable bed in camp. Take two bolster slips made of any light material, as chintz or lawn, and stuff them with dry straw, bracken, or hay. Tie them loosely together top and bottom, spread your blanket or eiderdown on them, and lie *between* them, not on top. Then bring your eiderdown over you, tuck up well, and place your other clothes over the eiderdown, and you will sleep like a top. Do not err on the side of too few clothes. Many novices I have known have spent nearly all their first night tramping the lanes to keep warm.

(Top) The author starting out for a motor cycle camping holiday on her 6 h.p. Enfield.

(Bottom) A camp at Borth-y-Gesh, Portmadoc, North Wales. Many motor cyclists simply use the camp as a sleeping convenience, spending the days motoring in the district.

raining without suffering in consequence. On the floor is spread a proofed sheet, and over this a woollen ground blanket, which keeps the inside cosy and absolutely dry. For long stays it is better to place a little

A Holiday in the Open.—

There is a club which gives useful information, called the Amateur Camping Club, of 4, New Union Street, Moorgate Street, London, E.C.2. The entrance fee is only 1s. and subscription 5s. per year, and you can buy your kit from the club if you do not choose to make it. There are also several District Associations, one of which is at Birmingham. The hon. secretary is Mrs. E. Bosker, 2, Kingsleigh Road, Handsworth.

There are several hundred camp sites which members may use for the small sum of 6d. to 1s. per tent per night, or 2s. 6d. per week; when touring one may

use these sites or procure others, which is quite an easy matter. I have never been refused but once in my fourteen years of lightweight camping, in fact the reverse is nearly always the case.

The most convenient way to carry the kit is to pack it in one large basket containing all that is necessary for a fortnight's tour, a change of clean linen being carried in a small basket in the sidecar away from the dust.

In conclusion, I would urge all interested in open air life to give lightweight camping a trial. I shall be pleased to give any further information to those interested.

MARY RILEY.

IN THE COOL SHADE OF THE FOREST.

By F. Gordon Crosby.

Unsuspected beauty spots by the wayside are revealed to the explorer of by-ways such as that depicted—the sidecarists passing from the blazing light of the sun to the cool recesses bordering a wayside pool.

**Blackburn M.C.C.**

It has been decided to revive the Blackburn and District M.C.C., and two trophies have been presented for competition.

M.C.U. of Ireland (Ulster Centre).

Fine weather favoured the hill-climb at Red Brae, and there was a good turn-out of spectators, who lined the banks on both sides of the hill from the bottom to the top. Some very good riding was witnessed, and the winner of the first event was J. B. Johnston (Norton) and the winner of the second event J. W. Shaw (Norton). Mr. M'Lardy acted as starter.

Streatham and District M.C.C.

Results of the members' recent speed judging competition:

CLASS A (Sidecars).

1. J. R. W. Pallison (3/4 B.S.A. sc.), error 1m. 20s.
2. S. T. Tessier (8 Bat), error 1m. 40s.

CLASS B (Cycle cars and cars).

1. W. O. Oldman (8 Bayard), error 3m. 10s.

Hon. secretary, Mr. R. M. Hunter, 37, High Street, Clapham, S.W.

The Douglas Club (Nottingham).

A new motor cycle club has been formed in Nottingham. Membership is restricted to A.C.U. affiliated riders of the Douglas. Mr. Martin J. Wright, "Riverside," Trent Embankment, Nottingham, is the hon. sec. (*pro tem.*). He wishes to get together several teams to compete for the East Midland Centre Challenge Trophy, and will be glad to hear from Douglas riders. Mr. Wright is a Douglas enthusiast, having owned well over twenty of these machines.

Midland C. and A.C. (Birmingham).

Forms and competition particulars are ready for the Midland Cycling and Athletic Club one day motor cycle trial on Saturday, June 28th. These can be obtained from the hon. sec., Mr. F. J. Urry, Lucifer House, Lionel Street, Birmingham.

The trials committee have now completed their survey of the course, which runs into something just over 200 miles in length, and takes in a good many new features both in hills and descents, so that competitors who intend to enter should see that their brakes are in perfect order, both for their own safety and for the reason that failure on the brake test means total disqualification.

The trial will pass through some of the most beautiful country in the British Isles.

As a sporting event with some real purpose behind it, the Midland trial should be a success.

Future Events.

- June 19.—N.M.C.F.U., Leeds. Half-yearly General Meeting.
 JUNE 20.—A.C.U. COMMITTEE MEETING AT BRISTOL.
 June 20-21.—Sheffield and Hallamshire M.C.C. Reliability Trial to Holyhead for Hulton Shield.
 JUNE 21.—BRISTOL M.C.C. RALLY AT ASHTON COURT.
 JUNE 21.—JUNIOR CAR CLUB. HILL-CLIMB AT SOUTH HARTING.
 JUNE 21.—MIDDLESBROUGH AND DISTRICT M.C.C. SPEED JUDGING COMPETITION.
 June 21.—Middlesbrough and District M.C.C. Run.
 JUNE 21.—OLDHAM AND DISTRICT M.C. HILL-CLIMB, BOOTH DENE.
 June 21.—Public Schools M.C.C. Surprise Competition.
 June 21.—S. Birmingham M.C.C. Run to Iron-bridge.
 June 21.—Western M.C.C., Glasgow. Run to Largs.
 June 21.—Woolwich, Plumstead, and District M.C. Run to Maidstone.
 June 21.—Yeovil and District M.C.C. Run to Lulworth Cove.
 June 21-22.—Blaenavon M.C.C. Run to Rhayader.
 June 22.—Birmingham M.C.C. Picnic Tour.
 June 22.—Eastern Counties M.C.C. Run to Trumpington.
 June 22.—Essex M.C. Run to Harlow.
 June 22.—Manchester M.C. Inter-club Run with Liverpool M.C.
 June 22.—N.M.C.F.U., Leeds. Run to Garrowby. Slow Hill-climb.
 June 22.—N.M.C.F.U., Portsmouth. Picnic Run to Petworth Park.
 June 22.—Nottingham and District M.C.C. Run.
 June 22.—Rochester, Chatham, and District M.C. Run to Chiddington.
 June 22.—Western M.C.C., Glasgow. Run to Killearn.
 June 22.—Wolverhampton M.C.C. Run to Rudyard Lake, Staffordshire.
 June 22.—Surrey M.C.C. Special General Meeting at 7.30, Angel Hotel, Guildford.
 June 22.—Middlesbrough and District M.C.C. Run.
 June 22.—Rochester, Chatham, and District M.C. Run to Southend.
 June 22.—Blaenavon M.C.C. Run to Fiddler's Elbow.
 JUNE 26.—YEovil AND DISTRICT M.C.C. AND TAUNTON M.C.C. INTER-CLUB HILL-CLIMB.
 JUNE 28.—BIRMINGHAM M.C.C. SPEED TRIALS.
 JUNE 28.—LIVERPOOL M.C. TWENTY-FOUR HOUR TRIAL TO EDINBURGH.
 JUNE 28.—M.C.U. OF IRELAND. ULSTER CENTRE. RELIABILITY RUN.
 JUNE 28.—MIDLAND C. AND A.C. RELIABILITY TRIAL.
 June 28.—Western M.C.C., Glasgow. Old Crock Test.
 June 29.—N.M.C.F.U., Leeds. Run to Malham Tipton.
 June 29.—Rochester, Chatham, and District M.C. Inter-club Meet with Woolwich and Streatham Clubs.
 JULY 1 AND 5.—ARBUTHNOT TROPHY TWO DAYS TRIAL, PLYMOUTH DISTRICT.
 July 5.—M.C.C. Hill-climb.
 July 5.—Birmingham M.C.C. Social Tour.
 July 5.—Streatham and District M.C.C. Members' Reliability Trial.
 July 6.—Nottingham and District M.C.C. Inter-club Run with E. Midland Associated Clubs.
 JULY 6.—OLDHAM AND DISTRICT M.C. RELIABILITY TRIAL.
 JULY 12.—LIVERPOOL M.C. RACES AT COLWYN BAY.
 JULY 12.—WOLVERHAMPTON M.C.C. OPEN TRIAL.
 JULY 14-15.—M.C.U. OF IRELAND. ULSTER CENTRE. IRISH END-TO-END RELIABILITY RUN.
 JULY 19.—BIRMINGHAM M.C.C. MIDLAND CUP TRIAL.
 JULY 25.—ESSEX M.C. SPEED TRIALS AT SOUTHEAST.
 July 27.—Streatham and District M.C.C. Picnic Run to Ashdown Forest.
 AUG. 16.—S.E. COUNTIES INTER-TEAM TRIAL.
 SEPT. 5.—M.C.C. TEAM TRIAL FOR "THE MOTOR CYCLE" CUP.
 SEPT. 15-20.—A.C.U. SIX DAYS RELIABILITY TRIALS.

Manchester M.C.

Results of the Reliability Run to Buxton:

1. F. Mason (3/4 Triumph), 10s. error.
2. H. Ashworth (3/4 Triumph), 65s. error.
3. E. Paxinan (Baby Triumph), 90s. error.

Hon. secretary, Mr. F. A. Eltoft, 133, Oswald Road, Chorlton-cum-Hardy.

Surrey M.C.C.

A special general meeting of the club will be held at the Angel Hotel, Guildford, at 7.30 p.m. on Tuesday, June 24th, at which it is hoped all members will be present. An amalgamation with the Farnham and District M.C.C. will be considered.

An Eastbourne Club.

At a meeting held at the Gildridge Hotel, Eastbourne, it was decided to form the Eastbourne and District M.C.C. There are many keen motor cyclists in the neighbourhood and a successful first season is anticipated. The club, which will be affiliated to the A.C.U., is also open to owners of light cars and cycle cars.

Essex M.C.

The Southend speed trials have been postponed until July 23rd, owing to the illness of Mr. A. G. Reynolds, the timekeeper. The programme is now arranged, and may be obtained from the organising secretary, Mr. Harold Fuller, 51, Pulteney Road, South Woodford.

West Kent M.C.

The old Blackheath and District M.C. has been reformed with the title of West Kent M.C., and a prosperous period appears to be ahead. The hon. secretary is Mr. J. S. Wilson, Burnham Lodge, Lake Avenue, Bromley, Kent, who will be pleased to hear of motor cyclists in the district who wish to join the club.

Irish Twenty Hour Trial.

Out of fifteen starters in the strenuous twenty-hour trial organised by the Cork M.C.C., only six finished. The course was 344½ miles, and took in the following towns: Cork, Fermoy, Dungarvan, Carrick-on-Suir, Clonmel, Mitchelstown, Cork, Killarney, Waterville, Kenmare, Macroom, Cork. The route formed the figure eight with Cork as the central point. The following competitors started. Only those marked with an asterisk finished:

- *R. S. Russell (2½ Sunbeam)
- W. Lane (2½ Douglas)
- J. Gibbins (4¼ B.S.A. sc.)
- *Jas. Browne (2½ Douglas)
- A. Healy (2¼ O.K. Junior)
- W. P. Musgrave (4 Triumph sc.)
- *E. B. Russell (4 Triumph)
- Flurry (2¼ Lewis)
- *J. P. Frost (2½ Douglas)
- D. Duggan (2½ Douglas)
- T. R. Popham (6 Enfield sc.)
- *H. C. Johnson (2¼ Revere)
- *R. Pericho (3½ Scott)
- J. Cuddigan (3½ Indian)
- F. Merrick (3½ Humber)

CURRENT CHAT

Times to Light Lamps.

SUMMER TIME.

June 19th	9.48 p.m.
" 21st	9.48 "
" 23rd	9.49 "
" 25th	9.49 "

Revised Prices.

Prices are constantly fluctuating owing to the unsettled state of labour and the material market. The popular Levis is now £44 13s. The Allon has gone up £5.

A Pillion Load.

A press photographer on the London-Edinburgh run astride a 4 h.p. Triumph, carried his wife, two cameras, and a tent in which they camped out at Grantham. They completed the run.

High Prices.

One of the chief causes of the recent increases in prices of motor cycles is the decision of the Government to continue the national awards which were granted as a war measure and which, it was understood, would be removed after the war. These awards, as is well known, amount approximately to 25s. per week per man, and every manufactured article or piece of material which enters the motor cycle factories has to carry these national awards in every factory through which it passes. Any of our readers who may be in receipt of the national award must not grumble about the prevailing high prices.

Silence of 1919 Twins.

As an example of the silence of the modern twin, two competitors in the London-Edinburgh run, riding the new Clyno and A.J.S. sidecar, carried on an easy conversation while maintaining an average speed of 20 m.p.h.

Safety First.

The Automobile Association has adopted the motto "Safety First" for all future A.A. and M.U. road signs and warnings. The first signs to be brought up-to-date in this connection are the "School" and "Concealed Turning" warning notices, which bear the motto.

Police Traps.

We are informed that there is a police trap working on the main road between Hounslow and Staines, at the cross roads at Bedfont, just by the Minimax factory.

The trap mentioned in our issue of the 5th inst. as working on Sudbury Hill, Harrow, is now working on the Pinner Road, on the opposite side of the hill.

Lighter Motor Vehicles.

The *Autocar* is carrying on the campaign instituted by *The Light Car* (a sister journal now incorporated in the former paper) in favour of lighter cars. In fact, *The Autocar* makes a strong plea for an improved power-weight ratio all round, in which connection it is quite possible for motor cycle designers to effect an improvement both in solo and sidecar machines.

Special Features.

WHERE TO GO FOR A TOUR.

A REVIEW OF DESIGN.

NO AGE LIMIT.

Paris-Nice Next Year.

The Paris-Nice trial, an event which proved a success in 1913 and 1914, will be revived in 1920; date, February 15th to 30th. No doubt there will be a number of British competitors as hitherto.

Direct Representation Overseas.

Capt. Woodward, who recently contributed an article on motor cycle conditions and requirements in South Africa, has been appointed direct factory representative in British South Africa for Messrs Humphries and Dawes. Direct factory representatives abroad are very few where the British motor cycle industry is concerned, and this example set by the makers of the O.K. motor cycle is one which might well be followed by other manufacturers.

Old and New Government Motor Cycles.

The prices paid for the 4 h.p. Triumph and 2½ h.p. Douglas motor cycles sold at the Agricultural Hall, Islington, on Tuesday, June 10th, show that the high prices hitherto reached with comparative ease are now on the decline, and the tendency to buy a machine at any price was less noticeable. Keen competition was the rule, but the buyers had, apparently, fixed their maximum price and would not exceed it.

The best Triumph, from external inspection, had no carburettor or magneto, the clutch and saddle were also deficient, but this machine was sold for 38 gns.

The price for this "star" Triumph was run very closely by another of these motor cycles, in much worse condition, which realised 33 gns.

The remaining machines, in various stages of decay, were sold at prices ranging from 30 gns. to 16 gns.

Following the Triumphs came twenty new 2½ h.p. Douglas motor cycles. The price obtained for one of these machines at the last sale exceeded 80 gns., yet the highest price reached this time was 71½ gns. This figure was approached by two machines at 71 gns. and five at 70 gns. The remaining Douglases fetched an average price of 67 gns.

The sale, conducted by Messrs. Goddard and Smith, was well attended, and many ladies were present, possibly with a view to purchasing one of the Singer light cars included in the catalogue.

Members of the newly formed Royal Aircraft Establishment M.C.C., Farnborough, about to start on their recent opening run. This club has every prospect of a large membership and a successful future.

Motor Bicycles at a Profit.

It was announced at the Agricultural Hall, Islington, that a large number of motor cycles sold by the Disposal Board of the Ministry of Munitions were resold by the buyer in less than twenty-four hours at a profit of ten guineas each.

"Surplus."

We are in receipt of a publication issued by the Government, entitled *Surplus*, price 3d., the official organ of the Government Property Disposal Board; secretary, Major F. C. T. Tudsbury, O.B.E., L.L.M., Armament Buildings, London, S.W.1. In this book is contained full information concerning the disposal of surplus Government property of all kinds, tools, mechanical transport (including motor cycles), metals, etc. Provincial sales are to be held at dates to be announced hereafter at Manchester, Halifax, Edinburgh, Glasgow, Dublin, Birmingham, Colchester, Newcastle, Liverpool, Sheffield, Cardiff, and Leeds.

Atlantic Flight.

The Atlantic flight in 16h. 27m. is another victory for the internal combustion engine, which the motor cycle and motor cyclists have helped to develop to its present stage of perfection. The success was all-British—men, design, machine, and engines. These last were Rolls-Royce Eagle, two in number, and the flight is a tribute to the quality of the workmanship of the Vickers firm who produced the "Vimy" aeroplane, the makers of the engine, and of carburettors and magnetos.

The Lucas Magdyno.

The new Lucas Magdyno combined ignition and lighting unit made its debut on several machines in the London-Edinburgh run. The Magdyno which has been undergoing road tests

The new Lucas Magdyno ignition and lighting unit on an A.J.S. machine.

during the past two years, is the first British made apparatus of this kind, and probably will be "standard" on a large number of 1920 models which have been designed specially to accommodate it. It may be recalled that we also illustrated this unit when describing the new 8 h.p. Clyno in our issue for February 20th, this year. A Magdyno fitted to a competing machine, ridden by a member of *The Motor Cycle* staff, gives splendid results. Although the head-lamp was screened by tissue paper, the light was extraordinarily powerful though well diffused, and, consequently, without glare.

Specials' Farewell Dinner.

The A.A. Section, Headquarters Central Detachment, Special Constabulary, held a farewell dinner at Messrs. Gatti's, on Thursday last, Sir Nevil Macready, the Chief Commissioner of the Metropolitan Police, presided, and commented upon the splendid work of the A.A. motor section and of all the members of the Special Constabulary, who had so splendidly responded to the call in order to release other men for the Forces.

A Government Sale of Motor Cycles.

One hundred unused 2½ h.p. Douglas motor cycles were offered for sale by Messrs. Goddard and Smith at Islington, on Friday last, the 13th.

The price obtained for these models kept within strict limits, and did not exceed 73 gns. A few were knocked down for 59½ gns., but the majority fetched an average price of 66 gns.

Imports and Exports.

Import values of motor cycles and parts for May show a big increase over last month, the figures being £4,675 and £1,535 respectively.

EXPORTS.

A return to approximately the March figures was obtained, after the drop in April, by the exports value for May, which totalled £130,288, as against £62,076 in the previous month. The values for May of the three consecutive years are here given:

May, 1917.	May, 1918.	May, 1919.
£60,850	£48,861	£130,288

It is also of interest to note the proportions of the parts values to these totals for the three years—£19,298, £29,162, and £69,934.

PETROL IMPORTS.

Petrol importation in May amounted to 22,007,345 gallons, as against 21,564,131 gallons for the corresponding month last year. This quantity, however, is a big increase on the previous month's (April) figures, which showed that 16,090,485 gallons were brought into the country.

H. R. Lane, a competitor in the London-Edinburgh run, with his 4½ h.p. B.S.A., fitted with the new Lucas Magdyno.

A SCOTTISH OPEN HILL-CLIMB.

The Glasgow Western M.C.C. Event.

AN excellent entry was received for the open hill-climb organised by the Western M.C.C.—the new Glasgow Club. Forty-three riders altogether entered the following five classes:

Class 1.—Motor cycles having cylinder capacity not exceeding 350 c.c.

Class 2.—Motor cycles having cylinder capacity exceeding 350 c.c. and not exceeding 600 c.c.

Class 3.—Motor cycles having cylinder capacity exceeding 600 c.c.

Class 4.—Motor cycles and sidecars not exceeding 600 c.c.

Class 5.—Motor cycles and sidecars exceeding 600 c.c.

The winners in each class were decided on the formula: $\frac{\text{Weight}}{\text{capacity} \times \text{time}}$.

Competitors assembled at Canniesburn Toll, near Glasgow, at 2.30 p.m., where they were weighed. After these preliminaries, riders and spectators made for the venue, Garshake Hill, near Dumbarton, where they found the surface of the hill in splendid condition for fast times.

The first class was started at 3.45 p.m., Hancock (2½ A.J.S.), being the first man off. After rather a poor start, he picked up well and finished in good style. D. S. Alexander (2½ Douglas) made a good start, and, travelling at a high speed up the fairly steep slope, was timed at 48 sec., which was the fastest time in the class. D. R. Parsons (2½ N.U.T.) made a good climb, and, although not as fast as Alexander, was the winner on formula.

Class 2, for 3½ h.p. machines, produced some good climbs, J. Spence (3½ Rover) making fastest time, 48½ sec. Capt. Walker (3½ Triumph) ran him pretty close with 49½ sec., while W. Deans (3½ Ariel) followed with 50½ sec. Singularly enough, none of the 3½ machines equalled the time put up by Alexander (2½ Douglas).

Capt. Dickson (8 h.p. Zenith) on one of the hills included in the Western Glasgow M.C.C. open hill-climb on Saturday. Capt. Dickson rode from Montrose (over 100 miles) for the event.

The most thrilling riding was naturally seen in the big class. A. J. Carlow (8 Zenith) made a very spectacular ascent, taking the bend near the top close in; his time of 36½s. being fastest time of the day. A. Brash (7 Harley-Davidson) did not repeat his performance in the Glasgow M.C.C. climb, and lost a little time in cutting out to round the bend. His time was 37½s.

A surprisingly fast climb was that of R. McCulloch (6 A.J.S.). He ascended the hill at a great speed, his time being 39½s., which gave him an easy win on formula. A. J. Carlow (5 Indian) put up another good performance, obtaining second place on formula. Geo. Keely (5-6 James) also made a good climb.

D. S. Alexander (8 Enfield) had plug trouble, and practically accomplished the climb on one cylinder.

In Class 4 for 600 c.c. sidecars J. Spence (4 A.J.S. sc.) started off well, but when a few yards from the finishing line his gear control jumped out, nevertheless he made fastest time in his class, this being 71½s. Hancock (2½ A.J.S. sc.) obtained first place on formula, and made an excellent climb considering the small size of his engine. H. M. Fraser (3½ Sunbeam sc.) was second on formula.

In the large sidecar class, A. Brash (7 Harley-Davidson) made fastest time, only a matter of 10s. slower than his solo climb. The winner on formula was Geo. Kelly (5-6 James sc.), who did much better than in his solo effort.

D. S. Alexander (8 Enfield sc.) broke a chain at the start, while R. McCulloch (6 A.J.S. sc.) started off well, but, when half way up, his gear slipped into neutral.

For a first effort of the club, the climb was particularly successful, and the officials deserve every credit for the manner in which the arrangements were carried out. It seems to us, however, a pity that an obsolete formula should have been used, giving an undue advantage to weight and small capacity. It will be noted that in no case has the fastest competitor won on formula.

The results on formula are as follows:

CLASS I.

1. B. R. Parsons (2½ N.U.T.).
2. Hancock (2½ A.J.S.).

Fastest time: D. S. Alexander (2½ Douglas), 48s.

CLASS II.

1. W. Deans (3½ Ariel).
2. H. Gold (3½ Wolf).

Fastest time: J. Spence (3½ Rover), 48½s.

CLASS III.

1. R. McCulloch (6 A.J.S.).
2. A. J. Carlow (5 Indian).

Fastest time: A. J. Carlow (8 Zenith), 36½s.

CLASS IV.

1. Hancock (2½ A.J.S. sc.).
2. H. M. Fraser (3½ Sunbeam sc.).

Fastest time: J. Spence (4 A.J.S. sc.), 71½s.

CLASS V.

1. Geo. Kelly (5-6 James sc.).
2. J. Barclay (6 A.J.S. sc.).

Fastest time: A. Brash (7 Harley-Davidson sc.), 47½s.

The start of the Edinburgh M.C. one hundred mile sporting trial, held last Saturday. Reading from the left: Carfrae (3 h.p. Enfield), — Driver (2½ h.p. Douglas), and N. R. Fenwick (5 h.p. Rover).

THE 6 h.p. DOUGLAS.

An Attractive Sidecar Machine at Present
in the Experimental Stage.

The experimental 6 h.p. Douglas outfit, a powerful mount of very pleasing appearance.

FOR nearly two years Messrs. Douglas Motors, Ltd., have had a 6 h.p. model on the road, and, while nothing has yet been decided as to whether it will be marketed this year, a photograph of the machine cannot fail to interest.

Perhaps the first point which will attract notice is the all-chain all-enclosed transmission, the final drive being on the "off" side of the machine, which, incidentally, is very compact considering that a comparatively large flat twin

had to be accommodated. A three-speed gear with new type multiple plate clutch is fitted, which is interconnected with the gear change control, making the changing of gears, without declutching, impossible. Interchangeable wheels are also a feature. We tried this machine over a year ago, and were particularly struck with its exceptionally smooth running and ample reserve of power. Undoubtedly a Douglas sidecar machine of this power would be very popular and prove as efficient as the smaller models.

A "Benzole" Trial Among Welsh Hills.

Only Ten Competitors in the Liverpool M.C. Open Reliability Trial out of Thirty-four Starters secured First-class Awards.

THE first trial to be run on benzole turned out to be a strenuous test for even modern machines, and of the thirty-four starters only ten qualified for first-class awards. The course was 134 miles, and included Cilcain Hill and Bwlch-y-Groes, which proved formidable for machines running on benzole where carburetters had not been retuned. This and the strong following wind caused many machines to overheat.

The following are the official results, with notes:

1. L. V. Barton (8 Rex sidecar). Retired Cilcain, back wheel slip.
2. Mrs. Baxter (6 Clyno sidecar). Non-starter.
3. Harry Marston (6 A.J.S. sidecar). First-class award.
4. F. Smith (8 Clyno sidecar). Third class award. Failed Bwlch-y-Groes and Old Horseshoe Pass.
5. J. C. Walker (2½ Alldays solo). Non-starter.
6. J. W. Wills (4 Triumph sidecar). Third class award. 13 mins. out Bala.
7. J. A. Newmao (3½ Sunbeam solo). First class award.
8. H. T. Williams (6 A.J.S. sidecar). Failed on time at finish.
9. J. H. Fox (4½ B.S.A. solo). Second class award. Failed Bwlch-y-Groes.
10. C. R. West (6 A.J.S. sidecar). Retired Bala, clutch burnt out.
11. E. Jones (3½ Norton solo). Retired, sprained wrist.
12. O. Wade (6 A.J.S. sidecar). Third class award. 5 mins. late Bala.
13. H. M. Bell (3½ Rudge solo). Failed Cilcain. Retired Dinas Mawddwy.
14. S. Parker (5 Brough solo). First class award.
15. S. B. Reece (4 Triumph solo). First class award.
16. R. H. W. Brown (6 A.J.S. sidecar). Third class award. 15 mins. out Bala.
17. S. W. Phillpott (2½ Coulson-B. solo). Non-starter.
18. J. Dudley (3½ Sunbeam sidecar). Third class award. 6 mins. out Bala, return.
19. A. G. Cocks (2½ Clyno solo). Third class award. Failed Bwlch-y-Groes and Old Horseshoe Pass.
20. J. D. McLean (7-9 Harley-Davidson sidecar). Non-starter.
21. E. R. Wintle (5-6 James solo). Third class award. Failed Cilcain water splash; stop Dinas Mawddwy.
22. G. L. Fletcher (4 Douglas sidecar). Failed Bwlch-y-Groes. Finished late.
23. H. S. Jones (3½ Scott solo). Failed Bwlch-y-Groes. Finished late.
24. A. G. D. Cleese (4 Norton sidecar). Non-starter.
25. G. Dance (3½ Sunbeam solo). First class award.
26. E. L. Boston (3½ Sunbeam solo). Retired Bwlch-y-Groes.
27. G. S. Boston (2½ A.J.S. solo). Third class award. Failed Cilcain water splash; stop Bwlch-y-Groes.
28. H. Logan (3½ Zenith sidecar). Failed Cilcain, and retired.
29. H. Newey (2½ Levis solo). First class award.
30. R. G. Mundy (8 Matchless sidecar). First class award.
31. N. Brown (5 Indian solo). First class award.
32. V. E. Horsmao (4 Norton sidecar). First class award.
33. R. E. Pugh (2½ Levis solo). First class award.
34. J. Collins (6 A.J.S. sidecar). Disqualified (carried no passenger).
35. J. Swinton (7-9 Indian solo). Broke clutch Cilcain, and retired.
36. H. A. Brayshaw (6 N.U.T. sidecar). Non-starter.
37. R. C. Charlesworth (5 Zenith solo). Non-starter.
38. A. Dray (3½ P. & M. sidecar). Non-starter.
39. L. M. Southwell (4 Norton solo). Second class award. 30 secs. late Bala, return.
40. H. D. Ashworth (4 Triumph sidecar). Non-starter.
41. V. W. Goss (4½ B.S.A. solo). Third class award. Failed Bwlch-y-Groes 5 mins. late Bala.
42. F. Morris (3½ Edmund sidecar). Non-starter.
43. A. Wood (4½ B.S.A. solo). Third class award. Stop Cilcain. Foot sluggish and stop, Bwlch-y-Groes.
44. C. B. G. Gill (4 Triumph sidecar). Non-starter.
45. L. L. Sealey (4½ B.S.A. solo). Second class award. Stop. Bwlch-y-Groes.

TEAMS.

- 8, 10, and 16 A.J.S. Did not qualify.
41, 43, and 45, B.S.A. Best team performance, but did not qualify.
11, 32, and 39, Norton. Did not qualify.

LONDON-EDINBURGH OFFICIAL RESULTS.

Including Cars: 130 Gold Medals; 4 Silver Medals; 1 Bronze Medal. Two Awards held over. 17 Retire.

Excluding Four-wheeled Vehicles: 115 Gold Medals; 4 Silver Medals; 1 Bronze Medal. One Award held over. 14 Retire.

Whitsuntide Trials in Ireland.

Dublin and District Club.

BUT a small field took part in the second post-war reliability trial of the Dublin and District Motor Cycle Club on Whit-Monday. The course, of approximately 140 miles, was a fairly severe one, taking in some well-known test-hills in Co. Wicklow. Of the twenty-nine entrants, only fourteen presented themselves at the start. This was due chiefly to the uncertainty of catering arrangements and the non-delivery of new machines.

There were very few motor cycles of this year's make, and most of the riders were novices. The latter fact, coupled with the intricate nature of the course, resulted in only eight of the competitors completing the journey, and only one of these, R. Armstrong (5-6 h.p. Enfield sc.), secured full marks. Armstrong will probably be awarded the Dunlop Cup, but the result is subject to confirmation by the committee. The finishers were as follows:

D. Allen (3½ Norton)
R. Armstrong (5-6 Enfield sc.)
J. Redmond (7-9 Indian sc.)
R. Hewison (7-9 Indian sc.)

W. Redmond (5-6 Indian)
T. Redmond (7-9 Indian)
J. Smith (7-9 Indian)
C. Johnston (2½ Crescent)

The Cork "Twenty."

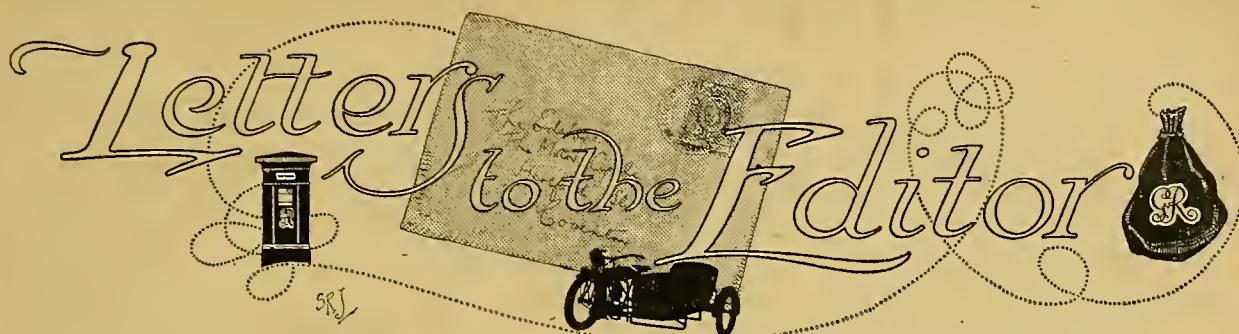

The open twenty hours' trial of the Cork Club on Whit-Monday did not attract many riders. As in the Dublin trial on the same day, the number of new machines was conspicuously small, only four of the fifteen competitors having 1919 mounts.

The trial started from Cross's Garage, South Wall, at 1.30 a.m. on Monday, passing through Fermoy, Dungarvan, Carrick-on-Suir, Clonmel, and Mitchelstown. Despite the relatively easy nature of the course, the field was reduced by half on reaching Cork. The second portion of the course was more difficult, but, contrary to expectation, six of the seven men completed the 345 miles. Gowlane and Ballaghosheen proved the test pieces of the route. The two Russells and Browne climbed both of the hills successfully, and, as all three were on time at all the open controls, they are likely to secure the chief awards of the trial. Those who finished were:

R. S. Russell (2½ Sunbeam)
J. Browne (2½ Douglas)
E. B. Russell (4 Triumph)

J. P. Frost (2½ Douglas)
H. C. Johnson (2½ Revere)
R. Perico (3½ Scott)

Letters to the Editor

The Editor does not hold himself responsible for the opinions of his correspondents.
All letters should be addressed to the Editor, "The Motor Cycle," Herford Street, Coventry, and must be accompanied by the writer's name and address.

BENZOLE AND TANKS.

Sir,—I notice in *The Motor Cycle* of May 22nd a letter from one, "Excelsior," concerning varnish for tanks. Allow me to mention that this is incorrect, at least in my case. Having a new 2½ h.p. Douglas, I wished to prevent the benzole from spoiling my tank, and, therefore, gave it a coat of Shellac varnish. The result is that whenever the benzole escapes now, a white stain is left behind, which can only be removed by the application of paraffin, which also takes off the first coating of enamel. I consider its effect very injurious.

T.H.

Redhill.

PRICE OF BENZOLE.

Sir,—The Automobile Association is informed by the National Benzole Association that the price of benzole conforming to the specification approved of by us is 2s. 8d. per gallon in fifty-gallon drums, and 2s. 9d. per gallon in two-gallon tins. While there is every hope that these prices will be still further reduced in the future, the following figures may be of interest to your readers as showing the advantage of using benzole: Price of No. 1 petrol to-day 3s. 1d. per gallon at most garages. Price of N.B.A. benzole 2s. 9d. Initial saving 4d.

It must further be remembered that at least 15% more mileage can be obtained from benzole than from the best petrol, and therefore the equivalent price per gallon of benzole to petrol is 2s. 4d. for the former, as against 3s. 1d. for the latter.

STENSON COOKE,
Secretary, the Automobile Association and Motor Union.

INFORMATION WANTED.

Sir,—Mr. R. A. Guthrie asks for some details of Mesopotamia. I have recently returned from Basra, and my advice is as follows:

(1.) Do not worry about dust; it will not be worse than English roads in summer, and will be too deep to ride in.

(2.) You will not worry about the heat affecting the tyres; if you go now it will take you all your time to keep yourself cool enough to live, and if you take the machine you

will forget all about it when you get to Basra. There are good hospitals in Bombay.

(3.) Basra-Baghdad district is rather wide. You will be lucky to get to Baghdad by boat up river in ten days from Basra.

(4.) Leave it at home. Buy an Army machine there if you still want to do a bit of exploring. Do not take any jewellery if you decide to do a lone trek—if you can get permission. Better still, stop at home and read about it.

C. H. KELK, R.E.

A 'VARSITY T.T.

Sir,—Would it not be practicable to arrange a motor cycle speed event—Oxford v. Cambridge—which might, in course of time, become a recognised annual 'Varsity T.T.?

The race would be held over the I.O.M. course, would be run under the A.C.U., and competitors would all be members of either of the universities *in statu pupillari*—as it is elegantly expressed—at the time of competing.

Class 1.—Solo machines, unlimited c.c.

Class 2.—Sidecar machines, unlimited c.c.

Class 3.—Solo machines not exceeding 550 c.c.

Mileage: Two circuits only to avoid undue strain to private machines; date during the Long Vac. August each year.

This would institute what might possibly prove to be the most popular annual event in the motor cycle world, bearing, as it would, the hall-mark of sporting amateurism. Neither have I any doubt that, in the event of the race being organised, the cups also would rapidly make their appearance from various sources. There is scope for much further elaboration of this scheme; I shall watch your columns with great interest to see how the proposal is received.

St. John's, Oxford.

H. MILLETT.

[This excellent idea has been placed before Mr. T. W. Loughborough, the secretary of the Auto-Cycle Union, who gives it his most hearty approval. In view, however, of the difficulties of organisation this year, he thinks it will be impossible to hold the race until 1920, when the event should receive every encouragement and assistance, and, in his opinion, should be a thoroughly sporting affair.—Ed.]

Scenes on Porlock during the Birmingham M.C.C. Trial for the Lycett Trophy. (Left) C. H. Hartwright (2½ h.p. New Imperial). (Right) L. Newey (4½ h.p. Ariel sidecar). Both competitors completed the double journey.

GOVERNMENT MOTOR CYCLES FOR EX-OFFICERS—AND MEN.

Sir,—May I beg a small space in your valuable paper in reply to C. Fitzgerald A. Bird's letter which appears in the issue of *The Motor Cycle* of June 5th.

He asks for concessions to be made to officers in the matter of the sale of Government motor cycles. It is a pity that he should exclude N.C.O.'s and men, who have seen just as much service, and who have made the same sacrifice as officers.

Another point that he seems to forget is that, with the amount of his gratuity so much in excess of that of the ranker, I suggest that the officer is in a better position to pay the market price for a mount.

Hampstead.

A DEMOBILISED PRIVATE.

HILLS ON WHICH I HAVE FAILED.

Sir,—Referring to the letter of "Sunbinks" in your issue of May 29th, making a comparison between various British hills.

I have never had the pleasure of seeing some of these Northern hills, except Houlster and Kirkstone, but so far as the Midlands, and Wales, and the South are concerned, does anyone know a longer or steeper hill than Alt-y-bady at Llangollen, the one that leads over the hill to Glynceiriog?

In 1912 I developed a craze for searching out stiff climbs, and this was certainly the stiffest hill that I struck that had got a genuine roadway wide enough for a vehicle to pass by, or for two sidecars to pass.

Compared to it, the Cotswold Hills (like Rising Sun, etc.) are quite trifles.

I have never heard of this hill (Alt-y-bady) having been included in a trial. Can anyone tell me?

NORA HOUGH.

[On September 27th, 1913, the solo riders were sent up this hill in the North Wales Trial held by the Liverpool A.C.C.—Ed.]

SCOTTISH FERRIES.

Sir,—I live in the vicinity of Inverness, and may say that A. Scott Freeman is quite wrong in stating that passes are now required for the far North. No passports whatever are necessary.

I recently travelled from Edinburgh on my lightweight Wolf. I may say that the roads are not at all bad, except some miles past Aviemore, and the main road North, as far as Brora anyway, is quite good too, excepting between Alness and Tain. Tourists might increase the pleasure of their trip by cutting down to Nairn from Carr Bridge by a byroad, which is in excellent order, and time may be profitably saved by going from Alness over the hills to Bonar Bridge. There is also a short cut again from Bonar Bridge almost directly to The Mound, of which advantage is rarely taken. June, July, and August are the best months for seeing the Highlands, and tourists should not fail to spend a night in Inverness, so that they can see the usual places of interest and also the following historic landmarks: Culloden Moor, Castle Tolmie, the Ould Bught Mill, Queen Mary's House, Demster Gardens, and Baron Taylor's Lane, where permission is readily given by John Brown, Esq. (the proprietor), to view the famous "Iona Martlecracked Sink Basin"; also the imposing islands known locally as Smith's Island.

DAN MACDONALD.

MOTOR CYCLE TRIALS.

Sir,—Much has been said and written about the unsatisfactory results of the trials lately held, and I am entirely in agreement with Mr. J. L. Norton and others that a more satisfactory method of "finding the winner" should be adopted.

Competitors, the trade and public alike, will welcome any scheme whereby one man is pronounced "the winner," as one horse wins "the Derby."

To this end my club, the Midland Cycling and Athletic Club, is aiming in its open reliability trial on June 28th.

As a member of the committee responsible for the trial, I can assure those interested that much thought has been given to the matter, recognising how difficult it is in these days of superlative machines and expert riders to give the "knock-out" under reasonable conditions of riding, as it should, in my opinion, be ruled out to include freakish ideas in reliability trials. Make them difficult by all means, but always possible.

The club is fortunate in having the services of Mr. Alec

Ross, known by every club as an official starter and marker in most important trials all over the United Kingdom, and Mr. Frank Whitworth—the original organiser of the Colmore Cup trial.

As there are four silver trophies to be awarded in this trial, as well as a premier trophy, the club is naturally anxious that there shall be no uncertainty as to who are the rightful holders of them at the end of that day.

Having these points in mind then, here is our programme:

- (1.) An extended course of 200 miles—rather longer than are most one-day trials—including six stiff hills.
- (2.) A brake test on a severe gradient of about 1 in 4.
- (3.) A stop and restart test on a gradient of about 1 in 6.
- (4.) A flexibility test; in the way this is being set out we consider it is original, and likely to prove efficient in determining the actual winner of the trophy without any question.

It follows the Colmore Cup lines, inasmuch as the slow time upon the flexibility test hill is divided by the fast time, but a new and original feature added to this is that the various types of machines have their chances equalised by dividing each rider's figure of merit by the average figure of merit of the riders on the same type and size of machine.

(5.) The timing in the trial will not be dealt with in any way on the split seconds idea, and marks will not be deducted unless the two minutes' variation is exceeded, i.e., one minute each way, which means that so long as the riders look after the minutes they need not trouble about the seconds.

(6.) Consideration will be given to the competitors in the matter of intervals, as we take them eighty miles on the first stretch, when a stop is made for a second light breakfast, and after a further fifty miles another interval for lunch. The final stretch of seventy miles is an uninterrupted run home.

If Mr. Norton (or anyone interested in motor trials), after reading what the club proposes to do, is not satisfied that a definite winner will be found by this means, the club would be most happy to receive any suggestions, which I shall be pleased to have and deal with.

C. F. DAWES.

O.K. Works, Hall Green.

FOUR-STROKE V. TWO-STROKE.

Sir,—I agree with "R.N." re two-strokes in all points except "hill-climbing." A two-stroke may beat a single of equal capacity on hills, but it certainly will not beat a twin. I have taken a Douglas up Red Hill (Axbridge-Bristol road) on top gear, and I should like to meet the 2½ h.p. two-stroke that would do this on a 5½ to 1 gear. Also, re overheating, I have driven the same machine for seven miles at 42 m.p.h. by Jones speedometer (Newbury-Reading road); the engine then only began to tire on up grades, but after a mile at 25 m.p.h. it regained its vigour.

Re spare parts, I think the Government is to blame in many cases. I was unfortunate some time back in breaking my gear box main-shaft (clutch model). I cannot obtain a new one owing to Government restrictions. Douglas Motors, Ltd., supplied me with the ordinary two-speed shaft and a fixed pulley; but I miss the clutch, and now often see riders of the same model who are using this shaft that I want, while having discarded the kick start and clutch operating mechanism.

DUGGIE.

Cambridge.

SUMMARY OF CORRESPONDENCE.

A correspondent recently borrowed a pump from Mr. A. Edwards, promising to leave it at the temperance hotel in High Street, Evesham. Finding four temperance hotels in that street on arrival at Evesham, he left the pump at Restall's Railway Temperance Hotel.

NOW READY.

HINTS & TIPS FOR MOTOR CYCLISTS.

Second reprint of Sixth Edition.

Invaluable to motor cyclists overhauling their machines.

Price 2/-, by post 2/3.

Obtainable from all Booksellers, or direct from

ILIFFE & SONS LTD., 20, Tudor St., London, E.C.4.

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Clutch Adjustment.

? How does the Clyno 1912 multiple clutch work? Supposing the clutch slipped, would you tighten it, because, when tightening the front nut, you push the whole of the outer shell against the back ball race?—G.T.

The Clyno clutch cannot be adjusted, and, if worn to any degree, extra plates must be inserted. Care must be taken in re-assembling to see that the cone nut is screwed up to the correct position according to the adjustment marks, otherwise trouble will certainly result.

The Lighting Regulations.

? I am given to understand that there is some special regulation concerning the size of lamps for roadway illumination on motor cycles and sidecars. I should be obliged if you could give me the necessary information on this point.—C.S.

Unless a lamp is fitted with a burner exceeding fourteen litres per hour, or an electric bulb exceeding twelve watts, and unless the front glass exceeds 6in. in diameter, there are no restrictions. In the case of these limits being exceeded, the glass must be obscured with ground glass, paint, or some other uncoloured material, so that the obscured effect is less than that produced by one thickness of ordinary white tissue paper.

Substituting Carburetters.

? I have bought a second-hand $3\frac{1}{2}$ h.p. Triumph, numbered 6,212, and shall be glad to know: (1.) What year was this machine made? (2.) What is the average consumption of petrol? (3.) Can you recommend me a Binks carburetter for economy in preference to a B. and B., which is on the machine? (4.) What position should the piston be in for giving best all-round results when timing the magneto?—H.B.

(1.) Write to the makers, the Triumph Cycle Co., Ltd., Priory Street, Coventry, giving them the number of the engine, and they may tell you the date of machine. (2.) Solo, ninety miles to the gallon. (3.) One carburetter is as good as another in this respect, and petrol consumption depends on the driver and the way in which the carburetter is adjusted. (4.) A method of timing is fully described in our handbook, "Motor Cycles and How to Manage Them." Approximately the piston should be on the top dead centre of the compression stroke, with the ignition lever two-thirds retarded, when the magneto contact breaker points are about to separate.

Difficult Starting.

? (1.) How does a Diesel engine work? Can it be run on ordinary lubricating oil and paraffin without injecting? (2.) I have a 5-6 h.p. Indian which I find difficult to start. If I were to connect the two wires of a four-volt battery, one to the frame and the other to the cut-out terminal, and walked the bicycle slowly along, when the contact breaker broke, would it induce a high-tension current in the outer winding and fire the mixture? (3.) Will you kindly tell me the address of the Thor motor cycle people?—O.T.H.

(1.) The Diesel is an engine relying on its compression to ignite the fuel charge. On the compression stroke only air is present in the cylinder. At the top of the stroke, when the air is fully compressed, and, therefore, at a high temperature, a quantity of the fuel is injected, and, of course, burns. Heavy oils and paraffin can be used, but we do not quite understand what you mean about injecting, as this is one of the vital principles of the engine. (2.) If you connect the battery wires up as you suggest, you will merely short the high tension current, and no spark at the plug would result. The magneto current is alternating, and the battery gives a direct current. (3.) The

address of the Thor motor cycle makers is Messrs. The Independent Pneumatic Tool Company, 600, West Jackson Boulevard, Chicago.

Purchasing by Proxy.

? A few days ago a friend of mine saw a machine which he thought would suit me, and he left a deposit of £1 and arranged for the machine to be ready for trial and inspection. As it did not come up to my expectations, I failed to come to terms with the dealer, who now refuses to return the deposit. Can you please advise me if this is in order, and, if not, what steps I should take to recover the amount?—F.C.G.

Unless the motor dealer successfully disputes the statement contained in your letter, you can issue a County Court summons for the return of the deposit paid, and you would have to bring your friend as a witness to show that the £1 was not paid as a deposit in respect of the purchase of the machine, but simply as security while you had it for trial and inspection, and that it was fully understood that the machine could be returned if you did not care to purchase.

Claim for Repairs.

? I should be glad of your advice on the following: I sold my $2\frac{1}{2}$ h.p. Connaught for £25, with lamps and horn complete. Purchaser was offered any trial he liked to give the machine. On account of never having previously ridden a motor cycle, he declined the trial, but paid for the machine, and asked me to deliver at his address two hours later. The machine was delivered running perfectly. Afterwards purchaser complained of trouble, non-starting, etc., which I put down to No. 3 war spirit and his lack of experience. The result is, of course, the machine is taken to a repairer, who fits new piston rings and charges £3 10s. for repairs, after keeping the machine three weeks. The purchaser sends the bill to me, intimating that in case of non-payment I shall hear more about it. Can I be made to pay this? The repairer says it is a comfortable, speedy mount, and desires to buy it. I myself have offered to take it back, but the price is now £28 10s. I have declined to pay or have anything further to do with it. Can I be compelled to pay this £3 10s.?—R.M.

Your letter does not disclose any right for the purchaser to claim successfully the £3 10s. he mentions, and we therefore think you should resist any such claim.

The silver challenge cup presented by the Raleigh Cycle Co. to the Nottingham District M.C.C. for annual open competition. Its value is 100 guineas.

Fitting Oversize Tyres.

? (1.) Is a 2½ in. tyre entirely satisfactory on a 2½ in. rim? I have the wheel out at present and several new spokes, and possibly rebuilding will be necessary. The machine is a 4½ h.p. and sidecar, and seems to be under-tyred with 2½ in. covers all round. (2.) How is a Bosch magneto sprocket fastened to the magneto?—E.B.

(1.) No; not unless it is a 2½ in. tyre built specially to fit a 2½ in. rim. The machine certainly seems to be under-tyred. (2.) The sprocket is a taper fit on the shaft, and is held in position by a nut.

Loss of Compression.

? I have a 1915 2½ h.p. Douglas and have had trouble with the compression in the front cylinder. I can get good compression for a few days, after which, for no apparent reason, it will mysteriously disappear to reappear again just as mysteriously after a short time. The engine is quite clean and well lubricated with good oil, and recently I fitted new piston rings with a view to curing the trouble. When the compression is poor there is hissing from the cylinder when turning the flywheel. Whether the engine is hot or cold seems to make no difference. I might add that, on turning the flywheel backwards, there is no hissing, and the vacuum set up in the cylinder renders the flywheel as stiff to turn as good compression. I should be much obliged if you could give me some explanation and tell me of a satisfactory cure for this trouble.—M.R.W.

The loss of compression is probably due to the valve tappets of the front cylinder requiring adjustment. Evidently there is too little clearance, and when the engine gets hot the valve stems expand and the valves do not close. It is possible that the piston ring slots are in line.

Converting a Triumph.

? I have a 1913 clutch model Triumph in good condition. Would you kindly tell me whether I could convert it into an efficient sidecar machine by the addition of a Philipson pulley, or would you advise selling it in favour of a similar machine with three-speed gear?—R.H.C.

We should certainly advise you to procure a machine fitted with three-speed gear in preference to fitting an adjustable pulley for sidecar work.

Timing a Twin.

? I have taken the engine of my a.i.v. 5-6 h.p. twin down for a small repair and have upset the valve and magneto timing, but they are not marked. What is the correct timing for this twin?—A.H.S.

In twins with automatic inlet valves, it is only necessary to time the rear exhaust valve; this is done by revolving the engine in the direction in which it usually runs until the rear piston is about ½ in. down the stroke, when the exhaust valve should just have closed. To time the magneto, turn the engine over one further revolution in the same direction so that the rear piston is ½ in. down the firing stroke, place the spark advance lever in the fully-retarded position, and revolve the magneto armature, which is disconnected, until the points are just about to separate on the cam marked 1, then, keeping the piston and the magneto in this position, connect up the transmission again.

READERS' REPLIES.**Mysterious Trouble with a Two-stroke.**

Referring to your reply in the issue of May 29th to "A.W.," who cannot get his two-stroke to fire after running under compression downhill, the same thing happened to me twice. On both

occasions the timing of the magneto had slipped, and I attributed it to a back-fire. A certain amount of mixture is drawn into the cylinder and, running slowly downhill, the spark is too far advanced and a back-fire is caused, which alters the magneto sprocket wheel. I am endeavouring to prevent recurrence of this trouble by fully retarding the magneto when running slowly with the throttle closed.—F. A. HANKS.

I note in *The Motor Cycle* of May 29th "A.W.'s" mysterious trouble with his two-stroke. Mysterious, it is indeed, and, from my experience, it is uncanny. After the engine ceases to tick when coasting downhill, no amount of throttle manipulation will make my Radco strike up again. I generally, when near the bottom of the hill, put on half throttle, air a quarter, and lift and drop release quickly two or three times, and if this fails to make the engine fire I flood carburettor and repeat above. To overcome the trouble I sometimes shut down the throttle until the engine ticks occasionally and work on the release, which is bad, I know. A cut-out switch connected to terminal on magneto contact breaker cover works well, but engine starts up with a loud bang. My engine, I may add, works splendidly otherwise, and has just been overhauled, and everything seems to be set right.—H.R. (Cockermouth).

Stuck Rocker Arm.

Further to the query of your correspondent, "D.B.H.W.," regarding the stuck rocker arm on the magneto, I have a Bosch fitted to my B.S.A. which suffers badly from this disease in wet weather, but the best tool I have discovered for reamering the hole out in the fibre bush is the long locking screw which one has to take out before the make and break will come adrift. The diameter of this screw over the threads is just O.K., and if pushed (not screwed) through the fibre bush a few times it leaves a hole the correct size. An extension of this idea would be to have the unthreaded portion of the screw fluted like a reamer just above the screw threads.—G. W. LAMBERT.

RECOMMENDED ROUTES.**CHELMSFORD TO FELIXSTOWE.—S.P.S.**

Chelmsford, Witham, Colchester, Capel St. Mary, Felixstowe. Approximately 63 miles.

ALFORD TO NORWICH.—J.H.

Alford, Spilsby, Boston, Sutterton, Fosdyke, Holbeach, Long Sutton, King's Lynn, Swaffham, Dereham, Hockering, Norwich. Approximately 114 miles.

AMERSHAM TO NEWTOWN (N. WALES).—F.H.G.

Amersham, High Wycombe, West Wycombe, Wheatley, Islip, Bletchington, Enstone, Chipping Norton, Evesham, Worcester, Tenbury, Ludlow. Craven Arms, Bishop's Castle, Newtown.

TENTERDEN TO BRISTOL.—T.R.H.

Tenterden, Goudhurst, Tunbridge Wells, East Grinstead, Horley, Redhill, Reigate, Dorking, Gomshall, Guildford, Worplesdon, Bagshot, Wokingham, Reading, Theale, Newbury, Hungerford, Marlborough, Chippenham, Bath, Bristol. Approximately 172 miles.

THE LONDON-EDINBURGH RUN.

Competitors being checked at York. The makes of machines shown are, reading from left: Matchless, Zenith, Triumph, and Sirrah Verus.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns.—First 12 words or less 2/-, and 2d. for every additional word. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd.,** and crossed **& Co.** Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.4), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. 000, c/o "Motor Cycle," 20, Tudor Street, E.C.4. Replies to Box Number advertisements containing remittances should be sent by registered post.

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements some mention of the district in which the car offered may be seen and tried.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged: when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR CYCLES FOR SALE.

A.B.C.

EARLIEST Deliveries of A.B.C.; book your order now.—Witham Bros., Newport, Wight. [1355]

LONDON'S LEADING REPAIR SPECIALIST.

F.J. YOUNGS

2, 3, & 5, The Parade, Kilburn, London, N.W.6 REPAIRS.

If your machine is worth repairing, have it done thoroughly!

Many motor cyclists have unfortunately suffered at the hands of the 'bodger.'

I have specialised in repairs for 20 years, and guarantee satisfaction with all work I undertake.

Special A.J.S., J.A.P., and MORGAN spares service and repair department.

Whatever you require I can supply—if it is in any way obtainable.

If you require a Second-hand Machine, I can probably suit you, but as machines are sold so quickly, it is useless publishing a list here, as this advertisement goes to press a week before it is published.

I can accept a few more orders for the following new machines. Delivery in strict rotation.

O.K.-JUNIOR. DIAMOND-J.A.P. IVY. SUN. RUDGE. ARIEL.

Special fitting agent for Capac specialities and the Easting Wind Screen.

Te'grams: "Yuparkil" Kilb, London. Telephone: Hampstead, 4807.

The Supremacy of the DRUID MARK II

Spring Fork has been attained solely by virtue of its complete and exclusive embodiment of all the essentials that combine to make a perfect scientifically-built fork.

It absorbs both Vertical and Horizontal Shocks even on the roughest roads; they are NOT transferred to the Frame.

Send for our Folder which explains all features of the Druid Mark II.

HEAD LAMP

Volex

British Made.

DRY BATTERY LIGHTING SETS

Volex Lighting Sets are the ideal, no-trouble outfits for the Motor Cycle and Sidecar. For over ten years they have been in use for this service, and of recent years in consequence of their dependency, the demand is constantly increasing. Dynamo Lighting Sets with Accumulators require careful attention and owing to complications have a tendency to go out of order. Accumulators if not regularly charged, whether in use or not, sulphate and become useless.

SIDE LAMP

VOLEX DRY BATTERY LIGHTING SETS give no trouble whatever. The battery which is fitted in a steel container with switchboard mounted on top, lies conveniently in the bottom of the sidecar, and with ordinary care will last, when in use, from six months to eighteen months without renewal. New Battery can be fitted in a few minutes at but little cost. The Battery Case contains three separate Volex 4-volt Aero Dry Cells, with separate connecting boxes for the cable to Head, Side and Rear Lamps. If one of the batteries become exhausted it can be replaced independently of the others. Unless specified, we always provide 4 volt Metal Filament Bulbs to each lamp, but 8 volt Bulb for Head Lamp will be provided where desired. Complete outfit (as illustration), including Head Lamp, Ball Pattern Side and Tail Lamps, 3 Volex Aero Dry Batteries in steel container with switchboard, Metal Filaments, Bulbs, and Waterproof Conducting Cords. Price £5 15s. Snare "Volex" Aero Batteries 12/6.

CAUTION—We would warn users that they may be offered substitutes for the "Volex" Dry Battery. No other battery will approach in reliability, durability, or capacity the British Made "Volex".

Sectional List, "VOLEX" DRY BATTERIES free on request.

Motor Houses and Cycle Sheds.

Built in five sizes, the three largest sizes made in sections which are mortised and tenoned together, a method of manufacturing which few makers adopt, but it will be evident to anyone that this method is infinitely superior to any other specification.

Specification: Built throughout from ½ in. selected tongued and grooved and V jointed matchboards in sections as described, to bolt together. Strong double doors, full width of end-bung on extra strong hinges and provided with lock and key and Tower bolts for holding door in position, also handle to door. Range of fixed framed windows in either side, complete with glass, extra strong roof covered with best felt and battened down. Wide barge boards on each end of roof. Sloping platform in front of door to allow of easy access of Cycle or Motor.

Sizes: No. 1, 6ft. long, 5ft. wide, 6½ ft. high, 172/6, floor 35/-; No. 2, 8ft. long, 6ft. wide, 7ft. high, 245/-, floor 56/-; No. 3, 10ft. long, 8ft. wide, 8ft. high, 405/-, floor 100/-; No. 4, 15ft. long, 10ft. wide, 9½ ft. high, 660/-, floor 210/-; No. 5, 20ft. long, 12ft. wide, 11ft. high, 890/-, floor 300/-. All carriage paid to nearest Station. Prompt despatch guaranteed. Inch boards 20 per cent. extra. See booklet for further particulars.

How Can a Motor Cycle or Car be Mechanically perfect

unless it is overhauled from time to time? Many of our clients are surprised that we can give the prices we do for second-hand machines, and yet sell at such a reasonable figure. We buy a machine, and we overhaul it before we sell it. The vendor gets the value of the machine less the cost of overhaul. The purchaser gets the machine at its true value. Where do we come in? We make our profit on the overhaul—got it? Quick returns and small profits, that is our business motto. Bear these facts in mind when you contemplate a purchase. Forty-two fine bargains in stock ready for the road. Twenty going through the shops.

347, FINCHLEY ROAD, N.W.3.

CHAIRMAN RHYMES.

*Often in the stillly night
And the wintry weather,
I have dreamed I'm on the bike,
Half-a-day together.
In my dream I always seem
Mile on mile careering
Deftly with a Chairman on,
Past the bobbies-steering.
But with Spring upon the wing,
Dreams are coming true,
For I'm on the motor-bike,
With a CHAIRMAN too.
5½d. for 10 everywhere.*

SUTCLIFFE'S MOTOR CYCLE and MOTOR CAR SHED

Length.	Width.	Height to ridge.	Price.	Floor extra.
6ft.	5ft.	6ft.	£ 9 0 0	£ 2 9 0
8ft.	5ft.	6ft.	£ 0 15 0	£ 3 4 0
10ft.	7ft.	8ft.	£ 17 0 0	£ 5 10 0
11ft.	8ft.	9ft.	£ 21 10 0	£ 7 0 0
15ft.	12ft.	10ft.	£ 33 0 0	£ 14 0 0
2½ft.	12ft.	10ft.	£ 46 0 0	£ 18 0 0

All sent carriage paid in sections.

Sutcliffe's Motor Sheds are the strongest built, best designed Motor Sheds you can get at anything like the price; designed to be tempted to buy weakly constructed sheds, they are most expensive in the end. Study Sutcliffe's Construction—Sides, ends, roofs built on 3-inch best match boards, roof also covered with extra heavy felt, rainproof framework of tremendous strength. All floors are double strength, will carry a ton or more weight easily. All houses erected and bored before despatch, all bolts supplied free. If any client is not perfectly satisfied, simply return shed and we refund purchase price. Full details in free booklet. (Can rail any size in 2 to 8 days. F. & H. SUTCLIFFE, 44, Wood Top, Hebden Bridge, Yorks. Phone—58, Hebden Bridge.)

MISCELLANEOUS.

DOUGLAS Parts.—23h.p. engine, £12; C.A.V. mag., £6; 2-speed gear box and controls, wants K.B. and controls, £6; frame, £5/10; forks, £3/10; pair wheels, fitted with heavy Dunlop tyres, tubes, £9; saddle, £1; carrier, 10/-; new tank, £2/10; £40 lot.—Hodgskin, Totley Rise, Sheffield. [X3586]

DOUGLAS 1912 Frame, complete, less tyres, saddle, perfect, £6; 3h.p. Singer, 2-speed wheel, less controls, tyres, belt new, pedal starter, large copper tank, sound bargain, £25; wicker sidecar, complete tyre, as new, £5/10; wanted, Morgan chains and spares.—Payne, Bryn Hafod, Llandudno. [X3198]

31h.p. Humber, clutch model, £12; 4h.p. Ariel, £12; 31h.p. N.S.U. 2-speed machine, £20; sidecar, £4; 31h.p. Triumph, £20; 6h.p. Bat, overhead valve, 2-speed, £26; 4h.p. Norton, £28; old machines taken part payment or bought for cash.—Motor Garage, Albert St., Idle, Yorks. [X3651]

BRAND New Lamp Sets in stock, F.R.S. Major sets, Powell and Hammer 127 H.B., 125 H.B., and 120 H.B., Lucas sidecar sets, Klaxon horns; genuine B.S.A. valves, complete, 7/6; tyre gaiters, 2/- and 2/6; 3/-; Dunlop covers, spanners, etc.—Wulbro Motor Cycle Works, Saffron Walden, Essex. Phone 45. [X3269]

BRITINOL.—British-made Tinol, past solder with flux combined. Place in position while cold, apply heat, and a perfect soldered joint is the result. No mess, no trouble, no tools required. Tins 3/3, post free. Free booklet on soldering with each tin.—Bi-Metals, Ltd., 57, Lamb St., Southwark, London, S.E.1. [X3298]

750 Amateurs are now building the Gibbons Mk. 11, cycle car. Two of our many testimonials: "A cycle car that is greatly needed"; "The smartest design I have seen." Send 5/- for registered working drawings with full details, also revised price list and layout of chassis details.—The Gibbons Cycle-car Co., Chadwell Heath, Essex. [X3213]

TYPEWRITERS! For the one-man business Blick typewriters are very suitable, the writing is visible, the machine is portable and quite easy to manipulate, being overstocked with this make. We are pricing these at 20% below market value for the next 7 days. Get list.—Reliance Co., the Typewriter People, Tram Terminus, Holborn. Phone: 2388. [X4000]

TYPEWRITERS that turn out satisfactory work at all prices: Remington's, 7 gos.; Early Remington's, 7 gos.; Remington at 12 gos.; Smith Premier, 12 gos.; Oliver's Visible, 16 gos.; together with a fine lot of the latest models all priced proportionately reasonable. On view in the windows and spacious showrooms, or sent on approval, of Reliance House, Tram Terminus, Holborn. [X4001]

WIND Screens.—Special types for Swan sporting sidecars, Middleton Flyer sidecars, and Henderson sidecars. We make wind screens for all types of sidecars from 21/-. Pillion seats in wicker from 21/-. We can also repair sidecars and reupholster cushions, etc. Our special Zepp body, complete with hood and screen, from 14 gos.—Aerlyte Screen and Body Works, Nightingale Works, Hornsey Rd., London, N. [X3542]

DISCS.—Our patent Flybro discs are lighter than metal, and do not rust nor rattle. We make to fit any type of wheel. Grade 1 Flybro £1 per wheel, Grade 2 15/- per wheel, finished black; any special colour 2/6 per wheel extra. Douglas sets, Grade 1 Flybro, aluminium finish, with blue line to match tank, £2/5 per set. Buy your discs from the makers.—Hill and Co., Disc Specialists, 1 and 3, Walmsley Rd., Bury, Lancashire. [X3209]

J.A.P. 23h.p. Cylinder, complete with valves, caps, etc., new, £4; Covey speedometer, £2; Remington typewriter, £5/10; Triumph pulley, £1; 230-volt D.O. 1/2h.p. motor, £3/15; 80 amp. accumulator, replated, £2; one 60 amp., replated, 35/-; A.J.S. piston, 21h.p., 10/-; Rex piston, 5-6h.p., 10/-; wanted, Philipson pulley for J.A.P. 6h.p., also Binks carburettor to suit 6h.p., 11ga. inlet.—Chimie, 59, Oswald St., Falkirk. [X3488]

TYPEWRITER Repairs.—Reliance Co.'s repair department is speeding up; all repair work is dealt with very promptly. If it can be done, Reliance can do it. Having on their staff a number of highly skilled mechanics learned in the actual factories that built the machines, the best possible work is put into all repairs and overhauls.—Ring up Holborn 2388, or rail to Reliance House, Tram Terminus, Holborn, E.C.2. [X4002]

CARBURETTORS.—20 lightweight B. and B. standard, 40/-; Pilot jet, 45/-; 100 band Klaxons, 36/-; Best and Lloyd's drip feeds, 15/-; 21h.p. J.A.P. cylinders, 45/-; Bowden double carburettor control levers, 12/6; motor cycle hubs, 16/- pair; lightweight Bowden inverted lever front brakes, 12/6; inverted lever exhaust lifts, 9/-; heaps other good; list sent.—Harris, 51, Upton Lane, Forest Gate, London, E.7. [X3783]

A.C. Sociable, less back wheel, £5/10; 5-6h.p. Pengeot cylinders, connecting rods, timing wheels, etc., lightweight Werner frame and forks, 25/-; F.N. frame and forks, 25/-; lady's frame and Druid forks, cheap; 1914 B.S.A. motor cycle, 2-speed, £52/10; 4-5h.p. Minerva cylinders, connecting rods, cheap; Triumph connecting rod, 20/-; F.N. tank, F.N. 4-cyl. crankshaft and cylinders, etc.; timing side of crank case for 31h.p. Premier; N.S.U. frame, tank, and back wheel and forks; Kerry loop frame, with fork attachments, 25/- lot; 3 Ford cylinder blocks, £5/10 each; Ford axle and differential cases, crown wheel, gears, timing wheels, etc.; 1915 Ford 2-seater car; £147/10.—Scotia Motor Works, 74, Upper Tooting Rd., London, S.W.17. [X3909]

MANCHESTER.

WHY have house and home turned into an Auction, dealing with numerous "probable" buyers, when your Light Car or Motor Cycle can be sold on commission at our Show rooms?

Upon receipt of a Post card our representative will call for your car or machine, and in due course a cheque for full amount, less our small commission, will be forwarded to you.

Consumption Tests.

IN their endeavour to find interesting competitions for club events, and methods of determining the winner in reliability trials, club secretaries will very likely institute fuel consumption tests. These tests are in themselves very valuable, provided that they are carefully carried out, and the ton miles per gallon might well be made the decisive factor when a cup winner has to be chosen from a number of gold medallists.

It has, however, been pointed out to us by a correspondent well known in the motor cycle world that competition officials when running trials of this nature should pay very special attention to the oil tanks of two-stroke motor cycles; for, if the oil tank be filled with a petrol mixture, it is possible for the machine to be run without any petrol passing through the carburetter. Almost phenomenally small apparent petrol consumption has been actually obtained, he says, by this means, where the consumption figure has been determined by the amount used from the legitimate tank.

We should be the last to suggest that there are many motor cyclists who would descend to such fraudulent practice; still, it is unfortunately a fact that such things are sometimes done, and it is most desirable, from all points of view, that a good performance in a fuel consumption test—as in a speed test or hill-climb—should be absolutely free from all suspicion of trickery. It has in the past been difficult occasionally to accept anything very unusual in fuel consumption figures, owing to the methods adopted for measuring the amount of fuel used, which have not always lent themselves to the extreme accuracy necessary for such tests over short distances. One method, for instance, is to fill the tanks at the start, and again at the finish, noting the amount of petrol required on the second occasion. In this case a slight tilting on uneven ground may make a very real difference to the result. A better plan would be to

empty the carburetters by running the engines and disconnecting the usual petrol pipe, attaching instead a small tank containing a carefully measured supply of fuel, and then run the machine to a standstill under observation. This method leaves very little room for error, but entails a certain amount of trouble and the provision of suitable auxiliary tanks.

Ease of Cleaning.

OVER and over again *The Motor Cycle* has urged the great desirability of making a motor cycle in such a manner that it can be washed down with a hose in the same way as a car is cleaned. We have shown designs of self-contained units from which nothing projected but a chain sprocket and the necessary control rods and wires. Even the sprocket can be covered in by a suitable chain case, or, if shaft drive be employed, it is a simple matter to make the transmission proof against mud and water. The same can be said for the bearings and other cycle parts.

The present-day motor cycle is a mass of corners and crevices, all of which mean a considerable amount of trouble in cleaning. Without going so far as the self-contained unit with a smooth exterior (this if carried to extreme limits would probably entail water-cooling), much might be done to render the labour of cleaning less wearisome by making the outsides of the crank case, gear box, etc., as free as possible from angles and projections, and by removing all superfluous lettering, which, while looking well enough when clean, harbours a quantity of dirt—dust and oil mixture in summer and mud in winter.

The complete frame and all small cycle parts should be treated by some rust-preventing process, and stainless steel used for all nuts that are exposed to the elements. We should then have machines which would be slow to show the ravages of time, and whose appearance would be a credit to manufacturer and owner alike.

A STRENUOUS WEEK-END.

A Combination of Reliability Trials.

THREE competitors in the London-Edinburgh Run went through the Liverpool M.C. Trial on Whit-Monday. These were Gordon Fletcher (4 Douglas sc.), Rex Mundy (8 Matchless), and A. G. Cocks (2½ Clyno). Fletcher carried his wife as a passenger, and when we saw the pair at the conclusion of their strenuous week-end, they appeared very little the worse for their several nights in the open.

Fletcher's "adventure" began by having to ride his Douglas from Bristol in the night three evenings before the start of the London-Edinburgh. The next evening he went to Eastbourne and back to fetch Mrs. Fletcher, and the whole of the following night was used preparing for the event.

The scooter which had created so much amusement at Highgate was seen *en route* on the running board of a Sunbeam car, to which it acted as a kind of tender.

At Grantham, Mundy bought, for 1s. 6d., some coupons which were supposed to admit him to the refreshment caterers. These, however, proved to be valueless, and the vendor had disappeared. Mundy carried the joke a point further by reselling the tickets to a fellow competitor for 2s.

Between York and Carlisle, eye troubles were fairly general, and Mundy was compelled to stop every few miles to bathe his eyes at wayside cottages.

A Harley-Davidson was passed on the roadside, and it was evident, from its condition, that the driver had fallen asleep and driven into the ditch. Thompson (Douglas) rendered assistance, and carried the competitor's A.C.U. "get-you-home" coupon to Appleby, where he arranged for a lorry to fetch in the machine. At Edinburgh, Mundy's pas-

Rex Mundy (8 h.p. Matchless sidecar) and Mr. and Mrs. Gordon Fletcher (4 h.p. Douglas sidecar), who competed in both the London-Edinburgh run and the Liverpool M.C. trial in North Wales—a strenuous week end.

senger preferred to camp out rather than to find accommodation at the hotels, and Mundy was not able to find him for the trip to Liverpool.

Fletcher and Mundy, with their sidecars detached, caught the 4.55 train out of Edinburgh. Sunday travelling by train proved very trying, but after several changes they arrived at Warrington at eleven o'clock, where they were met by J. Swinton, an energetic member of the Liverpool club, who, notwithstanding having to get back to Warrington and to start in the trial next morning from Queensferry, piloted them for ten miles or more on to the best road for Chester.

Swinton also provided benzole, and for the wholehearted manner with which he rendered service was voted a "good sport." It was now raining hard, and arriving in Chester at 2.30 a.m. the party went to an hotel, where they were treated well, although no beds were available. It was too early for breakfast when they left for the start of the Liverpool trial, but this did not seem to disturb any of the enthusiasts, including Mrs. Fletcher, who, by the way, is an old hand in competitions.

Before her marriage she was Miss Hamnett, by which name many of our older readers will recall her.

The Matchless and Douglas were now taken through the Welsh trial, but owing to the use of benzole without retuning the carburetters the engines of all the machines in the trial showed signs of overheating.

Tuesday was spent by Mundy on business for the A.C.U., of which he is the engineer and travelling representative, and a start was made for London in the evening.

At four o'clock on Wednesday morning a puncture in Fletcher's rear wheel caused the party to stop, and, instead of mending it, the two men lay down on the roadside and journeyed to the land of dreams.

At 6 a.m. Mrs. Fletcher shamed them by waking them with the intimation that she had mended the puncture and arranged for breakfast at a cottage a little distance down the road.

Then the final stage of the journey was completed—a mere 150 miles or so, making a total of 800 miles. A strenuous week-end indeed!

HEATING THE INDUCTION PIPE.

IT is very desirable that a motor cycle engine should tick over when standing in the same manner as a car engine, especially if a sidecar be fitted, but this ideal is not often attained. Last week, however, we saw an engine that left nothing to be desired in this direction, the result being attained by means of a B. and B. pilot-jet carburetter and an exhaust heated induction pipe. The motor cycle was a 4 h.p. Douglas, used for experimental purposes by Messrs. Brown and Barlow, Ltd., and, while it was standing in the street with the engine running, it was quite easy to count the revolutions of the engine by watching the operation of the valves. We estimated that we counted the valve movement at the rate of 120 per minute, which gives 240 r.p.m., or about 3½ m.p.h. on top gear. On low gear

A special heating arrangement on the induction pipe of a 4 h.p. Douglas. This device has proved exceptionally satisfactory.

the machine would literally crawl. It was impossible to count the explosions in the street for the simple fact that one could not hear them. We were informed that the machine was capable of upwards of 50 m.p.h.

This wonderful slow running is achieved by preventing any condensation in the inlet pipe. If condensation is allowed to occur petrol accumulates, which presently finds its way to the engine and makes the mixture unduly rich. Opening the extra air port corrects this, but a moment or so later the accumulation of petrol is used up, the mixture becomes too weak, and the air must be again closed, and so on.

A similar fitment has proved equally beneficial to the water-cooled M.A.G. engine of a Morgan Runabout—in this case the induction pipe is warmed by the water.

The Buckboard Redivivus.

MOTOR cyclists, virile and technical alike, view Mr. Grahame White's new Auto-wheel buckboard with that kind of dismay which is akin both to amusement and contempt. The sensations with which they inspected the first scooter were renewed. I submit with all deference that, though neither of these newcomers thrills the marrows of a sturdy competition rider, yet they deserve a warm welcome from the most expert of us. Our sport and industry have been dominated and cramped from the outset by the fear-nothing, hard-riding type of owner. There are millions of would-be motor cyclists who are too timid to ride standard machines. The three features of motor cycling which fend off lots of women and quite a few men are speed, weight, and sideslip. Ignorance being bliss, it was far easier to start riding twenty years ago than it is to-day; for the puny Werners of that age were hard put to it to exceed 25 m.p.h., whereas the fiery monsters of to-day bear a nervy girl off down the road at 40 m.p.h., if her sleeve catches the throttle lever. (The scooter and the buckboard will run at 4 m.p.h.) Similarly, most of us have forgotten how we regarded the first motor cycle we ever tried to wheel, and what an abomination it seemed when we incautiously let its two-four hundredweight lean away from us (the scooter weighs fifty-sixty pounds, and the buckboard stands up all by itself—*ergo*, from a practical point of view, it has no weight). I should not be surprised if scooter-skids do not prove more lurid than some people imagine; their little front wheels steer very rapidly indeed, and if one of them did a real lightning lie-down, I fancy the passenger would be converted into a projectile with considerable lateral velocity. That remains to be proved, but the buckboard is skidproof. If it should pirouette round on grease till it is lost in its own blur, the rider would be none the worse, and there is neither height nor speed to render the tumble serious. This quaint pair of bantlings between them offers just what plenty of people who funk ordinary machines have been pining for. As such, we owe them a welcome: and I quite expect them to beget a numerous and creditable progeny.

Not Ambitious Enough.

INDEED, my main criticism of the G.W. buckboard is that it is too cheap. I have no doubt its price will widen its appeal, and I hope to purchase one for my son and heir to drive round the back garden until I can convince the local police that he has attained a licenceable age. But if my own nerve collapsed, so that I dare not venture forth with two wheels upon grease, I should desire a nobler vehicle than this rockbottom of simplicity. I should want more speed and power, not to mention a variable gear, for no Auto-wheel could approach my house by road except with a G. A. Olley doing l.p.a. over it.

Although controversialists in this journal besmirch my technical credit, I am too much of a mechanic to love a clutch which consists of slipping my back tyre on the 'ard, 'igh road. In other words, I want an altogether more ambitious buckboard; and two little birds at least whisper to me that my desires may not pass ungratified when I get a little more doddery, and the fireside begins to grip me in winter. Nevertheless, what am I but a hardened motor cycle maniac? It is not for such as me that the scooter and the auto-wheel buckboard have been begotten. The days may come when loving youngsters will present dear old Grandpapa Ixion with one or the other on his seventieth birthday—ugh!

Amateurs and Shamateurs.

MR. Leatherbarrow's suggestions for the Six Days Trial will probably command fairly general assent from the riding world. It is questionable whether either the trade or the expert (and largely honorary) administrative staff will welcome two separate events (passenger and solo). He omits the profoundly vital question of "finishing condition." I consider it bad policy to limit emergency gear ratios. All club committees will be grateful if Mr. Leatherbarrow can help them to identify the pukka amateur. The best definition I know is that a man should be employed full time at a job which is not directly or indirectly connected with the motor industry; but this presses rather hardly on two types of owner, viz., the moneyed idler and the apprentice at, e.g., a steel works, who may be the purest of amateur motor cyclists, although he is a professional engineer.

Gear Ratios in Trials.

I AM going to enlarge on this topic, because the suggestion strikes me as fundamentally unsound. It is merely the freak hill stunt in a new guise. Threatened with excessive bills for gold medals and the problem of finding winners for special prizes, the A.C.U. in a moment of intellectual stupor began to send the competitors up goat tracks which no rational person exceeding eighteen years of age would ascend in a state of sobriety. For a moment riders were stumped; but by the next year they downed the promoters with the aid of 18 to 1 gears and similar absurdities. The A.C.U. countered by utilising Porlock when smeared with a foot of mud equivalent to soft soap, by hunting for avalanches of sliding scree and other comicalities. If the process continues, we shall see the 1925 trials climbing trees on bottom gears of 30 to 1, and aided by balloons inflated with exhaust gases. So far as a guarantee of hill-climbing goes, the public needs nothing more convincing than an ascent of a hill like Sutton Bank at a minimum speed of 20 m.p.h. on the last day of the trial. Freak hills, river beds, and 18 to 1 gears are tantamount to a con-

Occasional Comments.—

fession of incompetence on the part of the promoters, who have to find winners somehow, who do not want to make their gold medals too cheap, and who can ill-afford to award golds to 99% of the entry. I shall be very disappointed if the new committee do not devise a more excellent way; and I feel sure the job may safely be left in their hands.

A Reminiscence.

THE scenes on Porlock Hill in the 1912 A.C.U. trial were a veritable *reductio ad absurdum* of the ill-conceived policy attacked in my last paragraph. On the Friday night an excessive proportion of the entry had qualified for golds, the judges were in difficulties as to the allotting of several special awards, and much rain had fallen. A technical mission was despatched to Porlock to discover if the hill was rideable. None of the messengers made a clean ascent—speaking from memory, I fancy that only one got up, and he utilised the instalment system; the telephoned report was to the effect that dozens of motorists had vainly essayed the climb during the day, a hill-climb would prove a sheer lottery, and very few riders would get up without dropping marks. This was exactly what the judges required, so on the Saturday morning the competitors were duly despatched *via* Porlock. No fewer than *fifty-two* men lost upwards of fifty marks on the hill, whilst *twenty-eight* slithered up unpenalised. The fifty-two culprits included crack riders like Sirrett, B. A. Hill, H. Greaves, J. S. Holroyd, W. F. Newsome, P. Phillips, F. Sangster, two of the Scott team, S. Sawyer, the brothers Dixon, Reg. Holloway, Haslam and Griffiths on Zeniths, W. B. Gibb, Rex Mundy, Hugh Gibson, Charlie Collier, and many others. Of these fifty-two unfortunates, twenty-six had not previously dropped a solitary hill-climbing mark. Mr. Leatherbarrow's suggestion of minimum bottom gear ratios, if adopted in any trial, would merely put the entire entry at the mercy of incompetent committees, whose evil purposes would then be served by hills far more climbable than Porlock is after a week's rain. I hastily add that I was not one of the victims on this historic and humorous occasion, so that I write without malice. As "Veteran" recently reminds us, certain Scottish judges once adopted an even more cynical expedient, when on the last day of a long trial they sent the entry up the "back stairs" of Amulree.

The Tail Lamp Famine.

FOR some mysterious reason, the scarcity of such commodities as whisky, beer, Bolo majors, English beef, £50 1919 motor cycles, and dwelling-houses is a veritable superabundance as compared with the famine in motor cycle tail lamps. Some nimble-fingered gentleman of the road stole mine the other day, and I have tried all the leading London and provincial houses without meeting anything but derision from the salesmen. If they are truthful, there has not been a motor cycle tail lamp delivered since the Armistice. I have even endeavoured to buy one tenth-hand, proffering its weight in gold, but to no purpose. I have essayed to steal one, as people do when their umbrella is taken "by mistake," but tourists appear to detach these fittings, and go to bed with them. I have a car tail lamp in my garage, so, gentle reader, if you meet a Baby Levis purring through the twilight with a 12in. paraffin Dependence tail lamp secured on its carrier by eight yards of barbed wire, you will know that you have caught one fleeting glimpse of that elusive pseudonym "Ixion." Have the Huns nefariously got their own back on us by cornering the world's output?

A Ready Mind.

THE other day a trade rider, testing a new flat twin, emerged from a door, wiped his lips, and endeavoured to start the engine. Two demobilised officers (of the strong, silent type) had been inspecting the machine whilst the owner was lubricating himself. "Excuse me, sir," quoth the ex-major, stiffly, "but are you aware that your flywheel is running out of truth?" (Was he not? But trade riders engaged in testing experimental mounts must give nothing away.) "Not untrue, sir," he remarked, politely, "this is our new patent eccentric flywheel. It is formed with a counterbalance timed to help each piston over top dead centre. Good-day, gentlemen." And the astute one was off before the military could cross-examine him.

A good lie. But mark the sequel, for Nemesis doth dog him of unscrupulous speech. The Great Panjandrum himself did summon the trembling tester.

"Hey, Bilkins, what the — is this?"

"This" was a polite letter from a gentleman who appended the title "major" to his signature, humbly enquiring whether "your new patent eccentric flywheel which your tester showed me on the Leamington road the other day" was applicable to the 1913 model.

Capt. Sir John Alcock, D.S.C. (who, with Lt. Sir A. Whitten Brown as navigator) is the first and only airman to make a direct flight across the Atlantic. He is depicted above with his overhead valve racing Douglas

MY HOLIDAY—AND YOURS.

By D.C.H.

There are holidays which stand out in one's memory as being immeasurably more enjoyable than others. You can be sure of the "splendid holiday" wherever and whenever you may be going—if you take the right companions along with you.

I have just returned from the finest holiday I have ever spent, although, strangely enough, my companions were silent throughout its duration.

Nevertheless, these silent friends enabled me to bring back with me more pictures than the finest Kodak has ever taken. And the pictures are permanent—indelible impressions that will be with me for life.

Previous holidays had always been a combination of hectic amusement and bottomless boredom. Before leaving for this one I had argued to myself this way: "Always before there have been certain hours in my holidays that have hung heavily on my hands. What had I done with them? Nothing, or next door to it." I had lazed them away—dozing on the beach or in the garden. I supposed it was the only thing to do with them. Was I not on holiday?

A short time before this memorable holiday, several friends had been talking to me about Pelmanism, and the thought suddenly struck me: "Why not enrol before going off, and take these 'little grey books' everyone is talking about along with me as holiday companions?"

I did it—not without hesitation. I had always believed—fallaciously believed—that a real holiday should be a complete rest. No newspapers, no work, and no more thinking than necessary. I had never before paused to realise that, although the body may need rest, the mind needs change of thought—*mental* rest.

THE BEST COMPANION.

Don't run away with the idea that I sat studying the "little grey books" all day long, though. Not a bit of it. Pelmanism is not a tyrannous study. I bathed, played golf, tennis, and did all the other things one does when holiday-making. Then, in the cool of the evening, I used to slip one of the "little grey books" into my pocket, and stroll down to the beach, or into the garden, and there, at ease and peace with the world, I revelled in its fascinating pages. Literally *revelled*, because they were more entrancing than the finest novel I had ever read.

I had many happy leisure hours on this glorious holiday; but they were not lazed away. "The little grey books" made any odd hours literally golden, because I have come back to work not only refreshed and renewed in body, *but also in mind*. I am not possessed by that "after-holidays" feeling. I am gloriously alive, and my mind functions now as it never did a few short weeks ago. Ideas throng through my mind—ideas that are increasing my income, too. Life is immeasurably more interesting to me now.

If you who are reading this have not yet taken a holiday, you cannot do better than make the "little grey books" your holiday companions. Until you do

so you cannot realise what a fascinating thing a real holiday can be. A mental holiday, if you please, because the "little grey books" "spring clean" the mind, and sweep away the mental cobwebs, replacing them with clear-thinking, keen, analytical sense, and a glorious power of mental imagery.

There is a little book entitled "Mind and Memory," and it was after reading its fascinating pages that I decided to own a set of the "little grey books" it talked about. This little book has been read by 3,000,000 people. 500,000 have *acted on the advice it contains*.

You can have a free copy of this widely-read book, by writing to the Pelman Institute, 199, Pelman House, Bloomsbury Street, London, W.C.1. If you act on its advice, and take the "little grey books" with you, I promise you a holiday brimming over with interest, for you will enter upon a new mental world—you will see things clearly that you only glimpsed before. Problems that previously worried you for days will puzzle you no longer; you will see things, not "as in a glass darkly," but permeated with the crystal light your awakened faculties will shed upon them. You will think clearly through to the solution of any problem that presents itself. You will no longer guess about things—you will *know*.

"Pelmanism will enable you to clear your mind of vague and inaccurate information, and put you on the road to obtain, as quickly and cheaply as possible, the right learning."—Sir HARRY H. JOHNSTON.

"If Pelmanism has strengthened my logical sense, it can do the same for a woman who cares to take the course."—W. L. GEORGE.

"I can vision a new system of education in schools, the Pelman System: I can vision a public of nimbler minds and clearer judgment because of it."—ROBERT LORAIN.

"In my opinion, the Pelman method of brain building should be universal. I plump for Pelmanism each time."—General SIR O'MOORE CREAGH, V.C.

"Unless we are to sink in the world and bid farewell to the proud position which we have held for centuries, there must come another period—that of reconstruction. Here it is, I think, that the applied principles of Pelmanism may help us"—Sir H. RIDER HAGGARD.

"Pelmanism is not for the self-satisfied; nor for the easily satisfied, content with any way of life, no matter how narrow and poor; nor for the sluggard, too inert; nor the laggard, too idle. It is a means of energising, and energy is the master-force of everything."—Sir JAMES YOXALL.

* * *

Full particulars of the Pelman Course are given in "Mind and Memory," which also contains a complete descriptive Synopsis of the 12 lessons. A copy of this interesting booklet, together with a full reprint of "Truth's" famous Report on the work of the Pelman Institute, and particulars showing how you can secure the complete Course on special terms, may be obtained gratis and post free by any reader of "The Motor Cycle" who applies to the Pelman Institute, 199, Pelman House, Bloomsbury Street, London, W.C.1.

In answering this advertisement it is desirable to mention "The Motor Cycle."

NOVELTY IN COMPETITION.

The First Scooter Race. No Limit to Stopping and Starting Tests. A Sporting Afternoon's Trial in which Watches were Taboo.

THE FIRST SCOOTER RACE. A highly amusing event. The fastest scooter was estimated to do 15 m.p.h.

A COUPLE of burning questions in the motor cycle world at the present time are "How to determine a winner in competition without resort to the objectionable secret check," and "Motor scooters"—to stand or not to stand?

The first query is an ancient one, the latter is of much more recent origin, and it was partly with the object of assisting in the solution of the questions that the idea of a road test by *The Motor Cycle* staff was conceived. Thus it was that the various members of the editorial, artists', and photographic staffs converged on the Edge Hill range from London and Coventry last week on solo and passenger machines of all types and sizes. Three scooters—the Smith-Clarke, the Antoped (an American production), and the A.B.C. Skootamota—were at the hill, two, shame to relate, conveyed thither in the tonneau of a car, but the A.B.C., with its sensible pan seat, was comfortably ridden from Banbury ready for the fray.

Perhaps, naturally, the scooters formed the greatest novelty at first. Venturesome spirits disported themselves up and down, performed evolutions in the shape of circles as small as threepenny pieces and figure eights, as if practising for the blue riband of the skating world. Of course, the ladies of the party were immensely attracted by the "funny little" motor bicycles, and a queue had to be formed to enable each one to take his or her turn on the "joy bicycles." Stand up and sit down seats were provided, and

each formed his own opinion of desirable features of the ideal scooter by the comparisons afforded. It was indeed an edu-

cational event, for, despite all the prominence given to scooters, one doubts if three had ever before run together at one time.

A slow race for solo mounts, won on an Edmund spring frame machine fitted with the new "Union" power unit. The Enfield took second place.

Ladies rode the scooters without the slightest hesitation, and completely mastered the controls after a minute or two's explanation (Left) The Smith-Clarke scooter, a seatless model. (Right) The A.B.C. "Skootamota."

But the Autoped had developed a fit of the sulks, and was grunting up and down the course very disconsolately, perspiring individuals on that gorgeous day chasing it down the roadway.

Scooter Practice.

Apparently, the twist grip on the joy stick stuck, and no amount of adjustment would persuade the combined throttle decompressor to continue to work; but a more ingeniously thought out machine one could hardly imagine. By pulling the joy stick towards the rider the free engine is operated, and further downward pressure applies the brake. Starting, however, was not too easy, as the weight of the engine being so far forward, violent pushing to start resulted in the rear portion jumping up and kicking the rider on the calf. That vice did not deter the intrepid riders, for several fresh from the Army (there were six captains present) wore field boots! As a result the little American gracefully reposed most of the afternoon in the shade by the roadside, and it is now for sale at the bargain figure of £100!

So novel had these scooters proved that many well stocked picnic baskets were neglected during the luncheon hour.

Soon all present considered themselves sufficiently proficient to start in the great motor scooter race—the first of its kind—which was to follow. The event was run off in pairs, from the scratch mark, the winner of the heats appearing in the semi-final. During the heats each competitor judged his own speed (which formed one event of the afternoon), and an average was struck to determine the handicap for the semi-final and final events. A spin of a coin gave the choice of machines.

The seven heats in the first round were all wins for Skootamota, partly on account of the fact that, with its saddle, it approximates to a motor cycle, and most of the competitors were more accustomed to this form of vehicle than the newer type with platform only. The races, however, were closely contested, and, once away, the Smith-Clarke showed a good turn of speed. In the second

round, the Smith-Clarke was given 12 yds. start, in consideration of the fact that its engine was fifteen years old and scarcely a fair competitor for the latest Granville Bradshaw creation of the same capacity.

Edge Hill Climbed.

The results in the three races in the second round gave two wins to the Smith-Clarke, and in the semi-final each won one race. Finally, the little Clement Garrard engine, on the Smith-Clarke, roared as it had never roared before, and got home a winner of the first scooter race by about 8 yds. Later, however, the A.B.C. production levelled up matters by climbing the 1 in 7 gradient of Edge Hill, piloted by an eleven stone rider, which was a really remarkable performance for so small an engine with a single gear ratio. Slight assistance with one foot when in sight of the summit was all that was necessary. Incidentally this test was made to settle a wager between a scooter enthusiast and one of the staff who was sceptical.

Highest up Wins.

The next event was a single gear ascent of Edge Hill on a lightweight machine so adjusted that it could not possibly climb the hill—a simple test of driving skill. The winner, who had never previously seen the machine, got half way up the gradient before he stopped.

Here it may be interposed that no watches were used throughout the afternoon—The Motor Cycle staff have a natural objection to any trial decided by the watch, but prefer to concentrate on the survival of the fittest amongst the competitors.

The complete regulations for the six events of the afternoon were, as a matter

The winner of the sidecar class in the stopping and re-starting test—an 8 h.p. Victory Matchless.

Novelty in Competition.—

of fact, included on a postcard, which suggests that in many cases trials regulations are overdone.

Stopping and Starting ad lib.

The event which followed the test of driving skill was the most strenuous of the afternoon. The regulations for the event were quite simple, viz., acceleration, braking, and clutch tests. Standing start; two stops and re-starts at points indicated. Class I, solo machines. Class II, passenger machines.

It was a type of event calculated to weed out competitors who:

- (1.) Failed to handle their machines skilfully.
- (2.) Whose brakes were bad.
- (3.) Whose clutches were fierce or badly proportioned.
- (4.) Whose gear-changes were difficult and awkward to operate, besides which
- (5.) A premium was placed on acceleration between the tapes.

In the first heat a 4 standard Triumph sc. competed against a 4 experimental chain driven Triumph sc. Both machines went up well, but the latter had a

smoother clutch, and made the restarts without hesitation and won.

A 5-6 Rover sc. and a 4 Norton were matched for the second heat. Both were new machines in magnificent fettle. The Norton was away first, but the Rover got ahead before the first stopping point. The Norton rider, however, got away more smartly, and both roared up to the next stop. The twin, however, finally won the heat.

An 8 Victory Matchless was drawn against the chain-driven Triumph in the semi-final.

On the first section of the hill the "single" held its own, but at the critical moment the terminal jumped off the plug, which left the Jap-engined Rover and Matchless sidecars to decide the final heat, and the 8 h.p. mount won comfortably, though each machine re-started with ease on three occasions during the course of the climb.

Solo Riders Stop and Restart.

In the solo class a modern A.B.C. first competed with a rider of a 2½ two-stroke Excelsior, and, naturally, won. The 3 h.p. Enfield, though behind at

the last stopping place overtook and passed the Lea-Francis near the summit. The A.B.C. was then matched against a "Union" engined Edmund, and won, but lost the event in a final trial with the Enfield fitted with an R.C.F. carburetter, which, notwithstanding its age of five years, showed a fine turn of speed, and led all the way. The A.B.C. clutch was slipping.

Incidentally, a very favourable impression was obtained of the new Union power unit which the staff is testing at the present time. The new Norton and Rover, too, were exceptionally fast, and a little Excelsior demonstrated its power by climbing nine-tenths of Edge on standard top gear with an eleven stone rider.

The final event, a slow "race," for solo machines, was won by the rider of the Union-Edmund, who travelled so slowly that he had difficulty in balancing the machine. The Enfield was second.

A sporting afternoon's programme, attended by glorious weather, ended with those present being entertained to tea on the terrace at the Round Tower by the Editor.

A new event with an old background. The Motor Cycle staff of writers, artists, and photographers congregated at the Round Tower, Edge Hill.

A DESPATCH RIDER'S JOY RIDE.

WE recently came across about sixty D.R.'s on the road from Daventry to Banbury. They were on their way from headquarters, Wellingborough, to Banbury via Northampton, Weedon, Newnham Hill, and Byfield, returning via Brackley and Towcester.

The sergeant, with whom we had a chat while he superintended the repair of a punctured back tyre, informed us that the

men came from the Wellingborough Signal Depot of the Royal Engineers. Each man carried a scheduled route card and map, and where there was any doubt about turnings, etc., the data marks on the ordnance plan were given on the schedule, and such marks had to be followed. For instance, in the neighbourhood of Newnham the data marks 385 and 384 indicated that the riders coming from Weedon had

to pass the foot of Newnham Hill on the north side and continue from the inn at the hill foot to Badley without climbing the hill.

Supervised rides of this nature are just the thing to keep the D.R.'s at home depots from becoming stale, and the event was regarded by the section as an enjoyable little club event, although under military discipline.

A Commentary based upon Practical Experience and a Study of Overseas Opinions.

Carrying Room.

THE question of proper provision in the way of accommodation for tools and spares is a subject to which we have often referred; but a recent appeal from an overseas rider induces us once again to give this matter editorial comment. The ordinary design of motor cycle does not lend itself particularly to the carrying of spare equipment of any time, yet one cannot help feeling that both the designers of machines and the makers of accessories are insufficiently liberal in their estimate of the equipment anyone undertaking a serious tour may desire to carry. Even for solo riding in England, it is often difficult to stow away necessary equipment in safe and convenient harbourage, and one has only to view the machines of competition riders or the riders themselves in order to realise how totally inadequate are two small tool-bags for stowing away the various spares and accessories which are considered necessary.

To the overseas rider the problem is an infinitely more serious one, for, as our correspondent points out, his riding may lead him through hundreds of miles of country where repair depots of even the most crude kind do not exist, and therefore he is compelled to carry with him every conceivable article that may be wanted to save him from becoming utterly stranded.

Necessary Tools and Economy of Space. BEFORE proceeding further, it may be as well to consider in what manner

the "necessary outfit" can be cut down to the accommodation available, as there is no doubt that a large number of riders habitually carry a great deal that might advantageously be left at home. First, a large array of spanners is not necessary, and by

careful and judicious selection the tool-roll can generally be cut down to quite modest dimensions. The following may be quoted as all that is necessary in this respect:

- Large adjustable spanner.
- Small adjustable spanner.
- Valve cap key.
- Screwdriver.
- Pliers and wire-cutters.
- Square-nosed punch.
- Small cold chisel.

B.S.A. or similar multiple-ended key.

This is not a very formidable array, and if neatly kept together in a tool roll the same pannier will generally accommodate, in addition, a coil of copper wire, and a small box of assorted nuts, washers, bolts, cotters, and similar small items.

Thus we have all the heavy articles stowed away in one compartment, which leaves the other at our disposal for lighter and more fragile goods. Of course, every rider has his own pet gadgets, but the following may be set down as a fairly practical array for the second bag:

- Repair outfit.
- Spare sparking plug.
- Chain links.
- Pocket soldering outfit.
- Spare valve.
- Roll of insulation tape.

It is hardly necessary to point out to our practical overseas riders that there is nothing to be gained by taking, for example, a large number of chain links of exactly the same size. A half link, a clip link, a spare bolt, and one or two of the most likely oddments will see one out of any ordinary mishap, and the same applies, of course, in arranging an assortment of nuts and bolts.

British motor cycles in the goldfields of W. Australia. Mr. L. Watson, who sends us the photograph, says: "The Triumph sticks these sandy tracks very well, the only trouble being the insufficient ground clearance of the engine."

Overseas Section.—

Further-Necessities. THERE still remain, however, more bulky goods to be disposed of. These are, or may be:

Spare inner tube.

Sensible sized oilcan.

Spare belt or chains complete.

Spare saddle, or fork, spring, or both.

Tin of engine oil.

The spare inner tube, bathed in French chalk, can be wrapped up compactly in American cloth and securely fastened under the saddle in the nook of the fork and resting on the rear mudguard. A leather pocket and carrier, rather resembling a knee grip, can very easily be made to embrace the fore end of the tank, so that the oilcan stands spout upwards and is instantly accessible, but generally the rider is left to exercise his ingenuity in stowing away the remaining articles according to the design of his machine. He is wise if he strives to locate them as near midships as possible, as they are then saved a good deal of jolting, and thus are more likely to retain their respective places of anchorage. The rear down tube and the lower tank tube frequently form convenient points of attachment for odd gadgets.

A Selection of Letters from Readers scattered all over the World.

The Export Market and Manufacturers.

The following letter from Mr. J. VERNON C. BROOK, though not from an overseas reader, bears so strongly on an important phase in motor cycle trade that we insert it in the Overseas Section:

"Recent experience in asking English motor cycle manufacturers to quote for machines for the South American markets leads one to believe that English manufacturers are to-day taking a line of least resistance as regards selling their output, viz., filling their books with orders for the home market almost to the entire neglect of the foreign markets, for which they will probably be yearning in a few years' time.

"The majority of manufacturers, when approached and asked to quote for a sample machine for the South American market by a large firm of export agents, replied to the effect that they could not undertake to deliver a machine in less than four to six, and in some cases eight, months, and the prices quoted were only those prices which are usually quoted to their English agents.

"Surely now is the time to endeavour to enter the foreign markets with motor cycles. American competition looms largely ahead, and reports from representatives in foreign markets, particularly in South America, are all in the same strain, viz., 'The Yankees are here.'

"One would suggest that any enquiry from a foreign market should be given Al preferential treatment, and the very first machine out of the works should be shipped abroad at a price which would allow the minimum profit margin.

"There is no doubt whatever that English machines are in every respect equal to those made by our friends across the water, and, in fact, in the majority of cases they are infinitely superior, not only as regards the design, appearance, and reliability, but also as regards what is perhaps the most important factor—their durability.

"One would also suggest that the Society of Motor Manufacturers and Traders should take this matter up with their members immediately, with a view to some consolidated policy being agreed upon in this matter.

"Doubtless manufacturers, after a long war and the strain entailed during the period when munitions was the cry on all sides, are elated on finding their books filled to overflowing with orders from home markets, which give the minimum amount of trouble as regards despatch, packing, payment, etc., and therefore do not trouble to cast around for orders which might entail more trouble.

"Surely this is the most short-sighted policy imaginable, as there can be little doubt that with the enormous increase of production and the large number of new firms which are

Additional Space. No rider is likely to object to too much carrying room, as the list we have set forth consists merely of the barest necessities. Many riders would not feel content with so modest an outfit, and if the tool bags were double the ordinary size, few overseas riders would experience difficulty in filling them.

The tank tool box, already in use on one or two American machines, has the advantage of accessibility, and is well placed as regards road shock. It is a most convenient arrangement for carrying light goods and the ever necessary duster. The knee grips designed to carry dusters and possibly a light shifting spanner are also commendable, as is a saddle provided with a pouch, in which a spare tube could be housed, for, so often when a tube is carried in an unsprung position, it is found to be rubbed and useless when finally required. The spare tube should not be exposed to light and dust, or it will speedily perish, and though the handle-bars may suggest a convenient harbourage, apart from the effect on the steering, it is a great mistake to load up the bars any more than necessity demands. Best leather cases may also be obtained which can be strapped to various parts of the frame.

entering into the trade, the time is not far distant when over-production, as regards the home market, will be the order of the day.

"By adopting this short-sighted policy, however, when this time comes it will probably be too late to enter into foreign markets with the same ease as would be possible to-day, not only because the demand would have been met to some extent, but also because American, and possibly even German, machines will have found their way into those markets, and the users will have become familiar with them; the agents also will push the sale of the machines which they know best, and general conditions will be more difficult than to-day.

"It is to be sincerely hoped that English manufacturers will realise their responsibility to the nation in this matter, and at once adopt a line of policy which will at least lead one to suppose that they are making every endeavour to enter into foreign markets.

"One would like to see this subject threshed out at length in your columns, as possibly there may be others who hold entirely different views on the matter."

A Good "Big Four" Performance.

Mr. A. G. SALMON, writing from Pietermaritzburg, S.A., says: "You will be interested to learn that the Norton put up the fastest time at the Pietermaritzburg Speed Trials, held on April 26th, and attained a speed of 68 m.p.h., and also secured first place at the Petrol Consumption Test, held on the same day by the Natal Motor Cycle Club, over a course of twenty-six miles. A big four secured first place in two of the most strenuous tests held in Natal, i.e., Pietermaritzburg Hill Climb. The hill was one mile long, strewn with boulders, and was merely a track. The machine was geared $3\frac{1}{2}$ to 1 on top, and took the hill with reserve power and picked up without the slightest hesitation. The winner's time was 1 min. 25 secs., the second man's time being 2 min. 15 secs., so you will see from this that the performance of the Norton was an excellent one.

"A point-to-point race was held over a nine-mile course, across country (no roads), bush, three rivers, sand, mud, etc., and a railway track of two and a half miles. It was only possible to cover the latter between the rails, and, as the sleepers were 2ft. apart and standing 4in. to 5in. above the ground, you will realise that this was somewhat of a test to call upon a motor cycle to accomplish. However, the Norton, ridden by Mr. Morcom, finished 47 min. ahead of any other machine. There were seven starters, and only two finished the course, the other machine being a Triumph."

LLANDRINDOD WELLS.

Touring Headquarters for Central Wales. Picturesque Notes.

By CHARLES G. HARPER.

As the A.C.U. Six Days Trials will be held in Wales, Sept. 15th to 20th, with Llandrindod Wells as a centre, the following notes will doubtless be read with great interest by would-be competitors and others who desire to know something beyond the details of road surface and gradient of the country through which the trial will pass.

NO more cheerful and convenient centre could have been found for the A.C.U. Six Days Trials next September than Llandrindod Wells, that up-to-date health resort of Radnorshire, which occupies a position at the gate of Wales, situated midway between north and south. Far removed from London—the distance is 176½ miles—Llandrindod, with its summer population of close upon four thousand, stands amid the mountainous hills of the most sparsely-populated county, where no industrial developments have come; with the great solitudes of Radnor Forest on the east, and on the west the heights of Cardiganshire, where the Wye, the Towy, and the Irfon rivers have their rise. Llandrindod is approached from London most conveniently by Oxford, North-leach, Cheltenham, Gloucester, Hereford, Kington, and New Radnor: a pleasant route in itself. From Birmingham the distance is 71 miles; from Manchester 130; from Shrewsbury 53; Chester 84; and Cardiff 72. Beyond Llandrindod the tourist comes in another forty-six miles to the coast of Wales, at Aberystwyth.

An Architecturally New Town.

Almost without exception, the towns and villages of Wales are an effect of grey and white, set amid the green-grey of the eternal hills. They are not beautiful as a rule. The tourist does not usually perceive this because of the setting amid the wonderful scenery. Llandrindod is in another key of colour: it is red. And, in its present guise, it is new. Nothing old about Llandrindod, except the parish church of the Trinity, from which the town and the health-giving springs of the wells derive their name. For Llandrindod means "Trinity Church," and the older Llandrindod, whose spa was originally discovered in 1696, and of the health resort which was fashionable about 1749, nothing remains save that church and the farm down below it, called "Llandrindod Hall." That occupies, more or less, the site of what was, in the eighteenth century, once the "Grosvenor" Hotel. There the invalids, real and imaginary, who came to drink the waters stayed, and there, too, came the rogues and the professional gamblers of that time, to prey upon the wealthy, as they did at Bath and other fashionable spas. For Llandrindod was fashionable then, in spite of that old-time difficulty of getting to the place. The gamblers ruined it: the hotel

was demolished, and the wells declined. Everyone thought Llandrindod was finished; and so, indeed, it was for that generation. The next saw it modestly recovering; for the healing springs are eternal; and each generation has its aches and pains, and over-eats itself, and behaves in ways it did not ought. And so there you are! In the days of that modest recovery, the visitors to Llandrindod were provincials, and it remained for the coming of the railway to bring back all the old popularity and more. Further, it remained for the great war—now happily over—to give such a stimulus to Llandrindod (and other British inland spas) as never was known. Aix and Homburg, Marienbad, and such Continental baths and spas, are "down and out," and our own resorts are reaping the benefit.

Scarcely a house in Llandrindod Wells is there which can have come to its twenty-fifth year. I love antiquity, but if I cannot have it, give me something quite new. Do not invite me to your has-been resort which was built and flourished in the architectural dark ages, when grey stucco was your only wear, and the dismal semi-basement breakfast room and other domestic dungeons prevailed.

Llandrindod, as I have said, is architecturally new. Also, it is red. It flowers scarlet in its brick and

Cefnlllys, near Llandrindod Wells.

Llandrindod Wells.—

terra cotta, like some geranium, and is eminently cheering. So, likewise, is the beautiful Rock Park in the centre of the town. It is a town of gardens, hotels, boarding-houses, and bands. And of automobiles. No need to be dull here. Yet, if you wish to commune with nature, and to be alone to think great thoughts, there, all around, are the lovely solitudes.

A picturesque corner in Montgomery.

There, half an hour or so away, down in its profound hollow, is Dyserth, or Disserth, consisting of a church and one farmhouse: a lonely spot which takes its name from its position in what were once the wilds—"the desert," in fact. And, in another direction, an easy walk, Cefnlllys ("Kefenlees" is the pronunciation), even more beautiful and inaccessible, for you must needs walk to it; while to Dyserth you can motor or cycle.

The most lovely and interesting run by motor cycle around Llandrindod is without doubt that northwards to Newtown. Indeed, I have a perfect little tour of delight for you; as thus: Llandrindod to Llanbister, $6\frac{3}{4}$ miles; Newtown, $17\frac{1}{4}$; Garthmyl, 6; Montgomery, $2\frac{3}{4}$; Bishop's Castle, 9; Clun, 6; Knighton, 7; Whitton, $3\frac{1}{2}$; New Radnor, 6; Llanvihangel-nant-Melan, 3; Penybont, 6; Llandrindod Wells, $3\frac{3}{4}$. This is a circular tour, totalling seventy-seven miles. From Llandrindod you proceed along the lovely valley of the Ithon, growing more beautiful as you proceed. Passing Llanbister, with its interesting church on the rise to the right, in another mile, beside the road and the river on the left, is the humble little church of Llananno. Well might the traveller pass it by: but that would be a mistake, for it contains one of the most wonderfully enriched ancient rood screens in Wales: a monument of the old wood-carver's art.

In the Severn Valley.

Then, passing Llanbadarn Fynydd, and rising to Clog Moor, 1,233ft., a long, long, and winding descent conducts you into the Severn valley and into the neat and pleasant Newtown, at a junction of roads whence you may proceed to any place you please. We continue to Abermule and Garthmyl, and there turn right for Montgomery, that decayed town of the splendid name and the historic past. Montgomery long ago gave up the attempt to compete with any other town. It is of the past, like the ragged ruins of its Norman castle on the wooded heights above. But it is a pleasant place on a summer's day. There is the great empty

square; and there, down below the Castle Hill, stands a lovely old group of houses, with the smoke from their chimneys lazily curling up to the background of trees. There are interesting and gorgeous monuments in the church; and in the churchyard (capture a native to show you where it is, otherwise you will never find it!) will be found the "Robber's Grave." It is illogically so-called, for the unfortunate man, named Newton, who lies there was unjustly convicted and hanged for highway robbery and murder which he did not commit; so he suffers the lasting indignity of a posthumous stigma. Tradition says that he declared, as proof of his innocence, that grass would never grow on his grave. It is marked by a white rose bush. Local superstition declares that cynical people who have sown grass-seed there have come by sudden and extremely unpleasant ends. However that may be, this observer noted that no bare place existed. In fact, the grass there was exceptionally luxuriant.

A Town of Hilly Streets.

This is a region of abrupt and striking hills. In the distance you see the Breiddin Hills, lovely beyond compare, with the pillar to Admiral Rodney prominent on them. And Bishop's Castle town, to which we now turn, is one of amazingly hilly streets. The Bishop's castle no longer exists, and nothing in the little town need detain the tourist. Here we turn south, and come past Clun and its castle to the little town of Knighton, of more crooked and steep streets. The westward road goes to Llandrindod by Bleddfa, but our way is still southwards, on to Whitton village, and is wooded and hilly. Two miles beyond, at Beggar's Bush fork of roads, we bear right, and come to New Radnor: a very small, very quiet place, called a "town," but really a village, and not, by a thousand years or so, so new as its name would imply. The even smaller Old Radnor, near at hand, is so old that no

A sixteenth century cottage near New Radnor.

Llandrindod Wells.—

one dare give a date to it. But New Radnor has the loveliest sixteenth century cottage that ever I have seen. You cannot help noticing it, for it stands prominently on the main road: the last house on the right as you leave for Llanvihangel-nant-Melan, beyond which we bear right at fork for returning to Llandrindod through Penybont.

Powis Castle, or "Castell Coch."

An interesting extension of the route detailed above would be that which would continue from Garthmyl to Welshpool, and on to the "Cross Foxes" Inn at Llandysilio; and thence proceeding to Lake Vyrnwy, that eighth and modern wonder of Wales—if, indeed, we have any room left in these times for wonder, which I doubt. Approaching Welshpool by a level road, with the canal on the right and the park of Powis Castle on the left, we find Pool, as it is styled locally and on the milestones, to be a rather ragged old town, somewhat lamenting the success of Newtown in taking away most of its flannel-making industry. Powis Castle stands romantically high. The Welsh call it "Castell Coch"—from its red sandstone walls. It is the ancient seat of the Earl of Powis.

The Largest Lake in Wales.

Turning left at the "Cross Foxes" by the modern church of Llandysilio, the road goes beside the river Cain, which gives part of its long name to the village of Llansaintffraed-ym-Mechain. And so, by Llanfechan and Bryngwyn railway station to Llanfyllin. After this comes the four-mile rise to Mynydd-y-Brith and the following steep descents to Pont Eynon. Lake Vyrnwy, the largest lake in Wales, now comes in view. The road on to Bala is an impossible one, and it is necessary to return the way we came, to Welshpool. There and back is seventy miles.

Another extremely attractive round is that detailed below. It totals 140½ miles. Leaving Llandrindod for Rhayader by Llanyre, we come in ten miles to Rhayader, a little town on the upper reaches of the Wye, greatly frequented by anglers, and latterly for the interesting lakes and dams formed for the Birmingham water supply at Cwm Elan. These, however, four miles distant in another direction, should form the object of a short excursion in itself. We pursue the Aberystwyth road, a main road, but very hilly, through Gamallt to the summit, Steddfa Gurig, 1,358 feet. Here the heights of Plynlimmon look down

upon the wild and desolate scene. Fifteen miles, mostly descents, lead into Aberystwyth, that popular seaside resort, too well known to need description here. The hilly coast road thence, to Aberaeron, sixteen miles, past Llanychaearn, and the steep Ffos-rhyd-Galed Hill to Llanrhystyd, is spectacular, and ends delightfully at the mouth of the Aeron river and that lovely valley which the eighteenth century poet has sung so attractively:

"The nymphs are gay,
The swains are hale,
Such blessings dwell in Aeron's Vale."

So bracing, eh!

It is therefore encouraging to know that our way lies along the Vale of Aeron. And very nice, too, except the steep hill at "Temple Bar" and Tycam Bridge, eight miles out. Five miles beyond is the dull little town of Lampeter, whence we proceed to Pumpsaint. The way to Talley grows easy, and extremely beautiful; the Cothi flowing along amid meadows, a remarkable change from the kind of scenery hitherto passed. Where the Vale of Cothi widens, with the tree-clad hills retiring to the background, are situated the ruins of Talley Abbey.

In a further eight miles the town of Llandilo is reached. Not an interesting town; and therefore the tourist need not hesitate to speed away down its High Street. The way now lies along the great mail-coach road to Llandovery, thirteen miles, past Abermarlais and Llanwrda. Llandovery itself, although a town of sorts, is a very rustic-looking one. Here, in the level strath, the rivers Towy, Bran, and Gwyddering come to their meeting place, and on a little mound by the waters stand the remains of the castle. The outstanding peculiarity of Llandovery would seem to be a queer taste for distemperer nearly all the houses with a salmon-pink wash.

Leaving the main road, "we come again into beautiful scenery at Glan Bran, and presently begin the rise to the Sugar Loaf Hill, a pass in the mountains; very grand and impressive. Thus we come into Llanwrtyd Wells, a small Welsh spa, with a fine modern hotel. Passing Cefn-y-Bedd, which means the "Ridge of the Grave," in Cwm Llewelyn at Cilmerri, a small obelisk on the right marks the spot where Llewelyn ap Gruffydd, the last native Prince of Wales, was killed, 1282. In another two and a half miles the small town of Builth is reached, and in eight more we come home to Llandrindod.

Talley Abbey, in the Vale of Cothi.

THE HIGH-TENSION MAGNETO.

Its Theory and Construction from a
Beginner's Point of View.

(Concluded from page 597—June 12th.)

IN our issue for June 12th, we gave the first instalment of this instructive article on the high-tension magneto, in which the author referred to the various parts of the instrument, their construction, and functions. We repeat the concluding paragraph of the preceding part of the article:

As the armature revolves in a magnetic field, and, if the contacts are closed, the armature also has a magnetic field of its own, there must be some distortion or displacement in the permanent magnetic field produced by this second or created field. In the appended diagrams, two conditions are presented.

(A) series represents the armature at different positions during a quarter of a revolution, or, to present the same thing in other words, passing from the position where the maximum flux is passing through the core of the armature to the position where the minimum flux is passing through the core.

The Lines of Force.

During the A series of diagrams (fig. 4) the primary winding of the armature is open circuited, say, by placing a small piece of insulating material between the contact points. It will be noticed as the armature revolves that the lines of force begin to leak across from the advancing armature cheeks (L) to the opposite pole shoe of the magnet system. This process, more or less, gradually goes on until all the lines of force are passing across from pole shoe to pole shoe via the armature core cheeks, while practically no lines of force are traversing the armature core. If the armature is revolved any further, the lines of force will again be reinstated in the core, but in the opposite direction. It is well to note here that this reversal of flux, or lines of force, is due to the change in the position of the armature, and not to any actual change in the direction of passage of the lines of force. If some device for showing the wave form of a generator (such an apparatus is commonly called an oscillograph) had been connected to the terminals of the primary winding, a voltage curve would have been produced by this rotational movement of the armature of approximately the shape shown in fig. 7. A voltage curve exactly similar in shape to this one would have been obtained from the secondary winding, but of a magnitude, when compared to the one shown, proportional to the ratio of turns between the primary and secondary windings. Now the maximum voltage that it is possible to obtain from the secondary of the average high-tension magneto is in the neighbourhood of 2,000 volts, that is, when the primary winding remains open-circuited, and the magneto armature is re-

volved at high speed. This voltage is quite inadequate for jump spark ignition, and again, is a quantity that varies with the speed of the machine; in fact, it is quite true, for all practical purposes, to say that this voltage is directly proportional to the speed.

The motor cycle engine is a variable speed machine, and if normal efficiency is to be obtained the ignition spark must be quite capable of producing the desired result at very low speeds as well as high. Also the instant of occurrence of the spark must be under very accurate control, otherwise the action of the engine would be most erratic.

It will be gathered from the foregoing that when the magneto is operated with the contact breaker open the machine is simply an elementary form of alternating current generator.

Now it is worth while at this point to review the fundamental laws governing the generation of voltage or e.m.f. by means of a conductor cutting through the magnetic lines of force:

1. The voltage generated is directly proportional to the number of lines of force if time and number of turns are constant.
2. The voltage generated is proportional to the number of turns in the coil that does the cutting if time and number of lines of force are constant.
- 3 (and most important). The voltage generated is inversely proportional to the time required in the cutting, other factors remaining constant.

How the Spark is Produced.

It will be quite obvious that the number of turns of wire that it is possible to wind on a magneto armature is limited, as is also the number of lines of force that can pass through the armature core. Therefore the only method of getting the necessary high voltage for jump spark ignition is to reduce the time during which the flux cutting takes place; in other words, the time required for the lines of force to leave the armature must be reduced to the absolute minimum. The lines must not be allowed to leave the armature core gradually as the armature revolves, as depicted in the A series of diagrams, but must be restrained until they are at such a tension that if released they instantly readjust themselves to such an extent that they leave the core entirely, and are even reinstated in the opposite direction. The way in which this is accomplished will be apparent by inspecting the second series of diagrams, B. In this series, the primary winding is short-circuited by removing (shall we say?) the imaginary piece of insulation from between the contact points, as mentioned previously. It will be noticed as the armature revolves that very few lines of force are leaking from the advancing armature cheek to the opposite pole piece compared with the same armature position in diagram A. What is happening is that the attempt to cut the lines of force has set up an e.m.f. in the primary winding,

Fig. 4.

The High-tension Magneto.—

and this e.m.f., acting in a closed circuit, has set up a current. This current, obeying natural laws, has established a magnetic field of its own, and as the polarity of the lines of force composing this field is the same as the lines of magnetic force produced by the magnet system, the two, for the time being, virtually become one.

The mutual attraction of these two magnetic fields enables the armature to drag or twist the main field produced by the magnet system around with it, until a position is reached where, if the main field be released, it will instantly desert the armature core, pass across through the core cheeks, and partly re-establish itself through the core in the opposite direction. When this position is reached, the contact breaker is opened by the cams, and, as the primary winding is open-circuited thereby, the current ceases to flow. This results in the immediate collapse of the magnetic field associated with this current, and as the main field is no longer subject to the influence of the armature field, it readjusts itself in a position depicted in the last diagram in series B. The interval between diagrams 4 and 5 of the series B (see fig. 4) is an extremely small fraction of a second. Now as the lines of force are closed circles, it will be obvious that before the said lines can leave the armature core they must pass through the windings thereon. The very high rate of change or rate of cutting lines of force that occurs at this point is the source of the extremely high voltage of the magneto. Once the above principle is comprehended, it will become reasonably obvious why the high-tension magneto produces a practically constant sparking voltage over a very wide range of speeds, for, as the writer has endeavoured to point out, the actual rotational speed of the armature has little or no influence or control over the actual rate of cutting magnetic lines of force producing the sparking voltage.

The Function of the Condenser.

We have not as yet mentioned the condenser's share of the work. As the primary winding, as well as the secondary, surrounds the armature core, when the contacts are opened a high potential difference would appear across the contacts. An arc or spark would result, which would not only allow the current to flow for an appreciable time after the contacts had opened, thus slowing up the rate of change of flux, and thereby reducing the secondary voltage, but would also dissipate the major portion of the energy, which would otherwise appear in the secondary spark or discharge. Some

device or method must thus be employed to enable the contact breaker to get "from under," so to speak. This is the function of the condenser, and without it a high-tension magneto is useless. What really happens, practically explained, is that the condenser momentarily acts as a short circuit, but a short circuit possessed of most peculiar properties. Without going into the theories of electro-static capacities, I might just explain that when a condenser is connected to a source of e.m.f. there is a momentary rush of current, which charges the condenser. As the condenser becomes charged, it builds up an e.m.f. of its own, which, having an opposite polarity to the charging source, soon stops the flow of current. Now, if the charging force be disconnected, and the terminals of the condenser are bridged by a conductor, there will be a momentary rush of current, and the condenser is discharged again.

Current fluctuations in one revolution.

This is what happens in a magneto: The current from the primary winding when the contacts are opened flows into the condenser, charging it, and raising its potential. When a balance is reached, the condenser immediately takes the upper hand, and discharges practically the whole of its store of energy back into the primary winding. This reversal of the direction of flow of current materially assists in reversing the magnetic field in the armature core. Therefore, the major portion of the total energy present in the armature core at the instant before the contacts open is impressed on the secondary winding, and appears in the spark gap represented by the spark plug.

To sum the whole of the foregoing up in a few words, we might say that the primary winding acts as a trap, by means of which the main field produced by the magnet system is caught up and twisted around until the lines of force are lengthened or stretched just as though they were rubber bands or springs. When a position is reached where, if the lines were released, they would snap or spring back, and thus cut through the windings at great speed, the trapping or restraining effect of the primary is suddenly discontinued, and the lines readjust themselves. The time required for the lines to take up their new positions is exceedingly small, and is governed principally by the efficiency of the design, and also by the quality of the non-permanent part of the magnetic circuit comprising the pole shoes and armature core. There is no destructive action on the magnetism of the main field during this twisting action of the armature, as it simply acts like a series of rubber bands or springs that are continually stretched and released.

Transformation of Energy.

The energy that appears at the spark plug in the form of an electric spark is simply a small portion of the mechanical work, that must be applied to the armature-shaft of the magneto to produce rotation, appearing in another form.

High-tension magneto armatures are often compared with ordinary induction coils, and, although a completely wound armature makes an excellent induction coil when supplied with a primary magnetising current, still the operation of the armature in the magneto is not exactly similar to the action of an induction coil. For instance, in the induction coil we have two windings, primary and secondary, similar to the magneto. The primary winding is used to charge or magnetise the iron core upon which the two coils are wound, and it is the collapsing of this magnetic field when the primary circuit is interrupted that produces the high-tension spark. In the magneto the iron core upon which the primary and secondary are wound is magnetised by the permanent magnet system. The primary winding serves to restrain the magnetism in the core while it is being revolved through approximately a quarter of a revolution. The spark energy for the induction coil is derived from the battery or generator, whichever the case may be, that supplies the primary winding with its magnetising current. The spark energy of the magneto is derived from the work performed in revolving the armature against the resistance of the magnetic lines of force to being stretched as depicted in series B (fig. 4).—C.C.P.

AN OPEN TRIAL FOR PASSENGER MACHINES.

No Secret Checks or Speed Judging in Midland Cup Trial on July 19th.

THE Midland Cup Trial of 1914 was a most successful and interesting event, and there is every reason to believe this competition, for passenger machines, will be very keen this year. The energetic Birmingham M.C.C. has arranged for the event to be held on the 19th prox., starting at 9 a.m. from Stratford-on-Avon, over a 160 miles course.

Secret checks and speed judging competitions are not included, and, in the event of more than one rider qualifying for the Midland Cup, gold medals only will be awarded. In addition to gold and silver medals, there will also be two team prizes for teams of three machines.

The trial will include hill-climbing, brake tests, stopping and restarting, and others tests. Sealed watches will be

carried by the competitors, who will be given one minute allowance either way on schedule time. Speedometers will be allowed. Entry fee for members is 10s. 6d., non-members 21s. Teams may be nominated at an extra fee of 5s. per machine. Entry forms and any further information may be obtained from Mr. S. Kempson Jones, 93, John Bright Street, Birmingham.

The Editor does not hold himself responsible for the opinions of his correspondents.
All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

N.S.U. GEAR CONTROL.

Sir,—Can any of your readers inform me whether they have been able to evolve any more up-to-date method of control than at present exists on the N.S.U. two-speed gear? The present method of control seems to me to be uncomfortable and obsolete. Any sketches would be appreciated by
WM. R. ARMSTRONG (2nd-Lt., R.G.A.).

COASTING WITH EXHAUST VALVE RAISED.

Sir,—Re Mr. Taylor's letter of June 12th. When going down hill with exhaust lever raised, why open the throttle and air? This surely is a great waste of petrol, and I find on my machine, when I coast with the exhaust valve raised and throttle open, that there are a series of loud bangs, which shows that the gas must be exploded somewhere, either in the silencer or cylinder.

If one closes the throttle altogether when coasting, does not the engine draw cold air in through the silencer and exhaust port, and so cool the hottest part of the engine?

I should be pleased to see any readers' opinion on this subject.
DOUGLAS.

Sutton Coldfield.

CLIMBING ON BENZOLE.

Sir,—In *The Autocar* of June 19th I read on page 622, re the benzole test on the Welsh hills, that "Bwlch-y-Groes proved formidable for machines running on benzole where carburettors had not been retuned."

May I say I have been up this hill in a non-stop run from Dinas to Bala on my $4\frac{1}{2}$ h.p. B.S.A. on benzole with the carburettor exactly as the firm sent it out for petrol. The jet was open one turn. The day was very hot and sunny. The ascent was done all on second, except the hair-pin bend at the bottom and a short bit on top. The engine showed no signs of overheating. I also ascended successfully on benzole, obtained at Bala, the hilly road from this place to Lake Vyrnwy, starting on the clutch after every stop at the numerous gates. The engine was quite cool on top of the hill.

London.

CLUTCH ADJUSTMENT.

Sir,—After reading the article on "Clutch Adjustment," by "Chinook," in your issue of May 8th, I cannot but congratulate "Chinook" upon the advice given. Endless troubles can be traced right back to either a badly designed or badly adjusted clutch, and if riders would only take the trouble to master the design of their particular type of clutch they would, in many cases, be surprised to find what improvements can often be made by merely adjusting the clutch spring pressure.

On three different types of machines, all fitted with Sturmey-Archer gears, I have been able to make improvements by clutch adjustment. The first came about through accident, but the accidental condition proved to be so beneficial that I investigated the matter and found that the benefits could be maintained by spring pressure adjustment, and ever since this occasion one of my points in tuning up a new machine has been to examine the clutch thoroughly and try to improve its adjustment.

I can only imagine that the various makers have been absolutely compelled to adjust clutches on the tight side in order to allow for careless or unintelligent handling, and as the few have to suffer for the faults of the many it will certainly pay the few to follow "Chinook's" advice and make what improvement they can.

To go a little further into the clutch question, I have always found the Sturmey-Archer with cork inserts capable of extremely good results. I understand that the use of cork is now abandoned (why, I cannot imagine), but if any of your readers can give me any reason I should be greatly obliged, for it might lead me to make further alterations to the clutch I have in use at the present time.
Coventry.
SPRING.

ONE-LEGGED RIDERS.

Sir,—I see sometimes in your columns accounts of how various one-legged riders have modified standard machines in order to get over their disability, and thought that my experience might be of help to others who, like myself, are disabled in the right leg.

Owing to "Jerry," my leg is quite stiff at the knee, and it is thus essential to have the right footboard much further forward than is common practice. I managed this on my A.J.S., which, by the way, I have no right foot controls, and is, therefore, eminently suitable for my purpose by removing the footboard, which is secured by two bars running under the crank case through eyes on the under-side of the board, and replacing it so that the rear eye and the front bar engage, the board being kept in position and tilted at an angle by a metal strap connecting the rear bar and the under-side of the footboard.

This, I find, gives a very comfortable riding position, and is an excellent support for my leg, since the angle at which the footboard is tilted can be altered by fitting a longer or a shorter strap.

The whole alteration can be carried out by any amateur, since it is only necessary to drill out one hole in the metal strap to take the screw which secures it to the footboard, and to bend the other end into a loop to fit over the rod referred to above.

Wimbledon.

B.T.P.

LIVE AND LET LIVE!

Sir,—Re the article under the heading of "The Youthful Motor Cyclist" in your issue of June 19th. I feel, as a youthful motor cyclist myself, with considerably over 20,000 miles to my credit, that I cannot let this go by without some criticism.

In the first place, your correspondent advocates fitting an exhaust system that will produce the maximum amount of noise. Does he consider this is decent behaviour, taking into account the danger and annoyance caused to other users of the road by this disgusting and ungentlemanly practice, which is calculated to get motor cyclists as a whole into disrepute with the general public and police?

Secondly, your correspondent remarks that a small workshop with lathe, etc., is desirable. This is quite unnecessary. The modern motor cycle is consistently reliable, and only requires such simple operations as decarbonising, etc., very occasionally. It is pure folly to mess and tinker with valve settings, etc., as the makers probably know more about them than amateurs. Thirdly, the real joy of motor cycling lies not in making a nuisance of oneself, but in touring and seeing as much as possible of this beautiful country that we live in. In conclusion, I may state that I sometimes meet such as your correspondent, dressed up in racing helmets and other ludicrous atrocities, imagining they are going a terrific speed, and they seem somewhat surprised when my five-year-old Scott sweeps past them with nothing more than a low hum.
Edgbaston.
CONSIDERATE.

DUAL-PURPOSE MOTOR CYCLES.

Sir,—I note with interest the letter of Mr. N. H. Kettlewell with reference to my appreciation of the design of the A.B.C. I do not wish to insinuate anything, and so I feel bound to reply to his letter and say that, in my humble opinion, the A.B.C. appears to be the nearest approach to the ideal for either solo or sidecar work.

My reasons are as follows: Though of very moderate weight the engine develops ample power; a four-speed gear is provided and the machine is sprung fore and aft; moreover, owing to the disposition of the cylinders, the cooling ought to be distinctly better than any other air-cooled machine that I know of. This, of course, is a very important point for sidecar work. Every motor cyclist knows, of course, that there are many suitable machines for both purposes, and the writer would be the last person to suggest that there were not; but the ideal is quite another thing, and I feel fully justified in spite of Mr. N. H. Kettlewell's remarks in expressing my opinion. I do not for a moment despise other machines.

Pennith. GEORGE TAYLOR, A.M.I.A.E.

BAKING THE SPARKING PLUGS.

Sir,—I am interested in "Ixion's" remarks on the subject of baked sparking plugs, especially in view of experiences of my own.

During the winter of 1915 I happened to be the engineer on a 75 h.p. six-cylinder Thornycroft motor boat. The engines on the earlier types of these boats and the one I was on were absolutely exposed to the weather, and though I did my best to protect mine with canvas from damp and wet, yet, with a cold and misty morning, which is of frequent occurrence by the sea, starting up in the ordinary way was impossible. Therefore, I used to take out the plugs, put them in a tray of petrol and bake them, and four times out of five a start was effected. In the fifth case all the wiring and coil, dual ignition being fitted, had to be removed and baked in an oven. The earlier Sunbeam aero engines, fitted with air compressor starting, used to suffer on damp mornings in much the same way. To my way of thinking, there is no special technical point attached to baking plugs other than the point that baking dries the plug throughout, and, should the interior of the engine be slightly damp, the plug keeps its points clear of moisture long enough to get the engine firing. RIF-RAF.

COURTESY ON THE ROAD.

Sir,—As an old reader of your paper and a motor cyclist for nine years, I should like to supplement the information given on June 5th in a letter from "AH1707." I am a native of the village of which he speaks, and myself went to his aid and tried to get the Harley-Davidson running, but his magneto had taken a fancy to water. I then offered to take the valve cap out of the Morgan and remove the plug, which they could not remove only by the aid of a vice. I also offered the use of two spare plugs, but was told they were faulty, so I left the Morgan and went to the aid of another in trouble. I have since fitted one of the plugs in my own machine, and it runs perfectly. I, as an old motor cyclist, make a practice of carrying one or two spare plugs, and I have always been able to continue my journey, if one has given out. JAMES. Shipley.

Sir,—It seems to me that some people have a curious idea of what they call "courtesy" on the road. Your correspondent "W.W.B.," in *The Motor Cycle* of June 12th, surely shows discourtesy to other motor cyclists

who do not stop when he has a puncture by the tone of his letter about them.

Personally if I have a puncture I get on with the job, and do not expect all and sundry who pass to stop and do the job for me. If I have real trouble I simply put up my hand to the first passing motor cyclist, and I have never seen one refuse to stop when hailed. When I first started motor cycling I often used to stop when I saw fellow riders at the side of the road, but I nearly always received the same answer, "no thanks, old chap," and so I dropped it and now do not stop unless signalled. Supposing everybody took "W.W.B." at his word when next he had a puncture, say, just outside Brighton on Saturday afternoon. I am afraid he would soon be like the General who always took the back streets because his arm got tired returning salutes. Perhaps he is thinking of the "old time" courtesy when motor cyclists were few and far between, and one would invariably stop when one saw someone broken down, but in these days I hardly think it is practicable.

There is one suggestion I would like to make on this matter. Why not have a signal of distress?

If a man has a breakdown and requires assistance, all he need do is to tie his white handkerchief to the off side end of his handle-bar. Not necessarily in the form of a flag, but just to hang straight down when tied by one corner. This would not be obtrusive, but would immediately convey to passing motor cyclists that the owner was in trouble and needed assistance. I do not think anybody would have cause to complain of the "lost courtesy of the road" if such a plan as this were advocated and spread by the motor cycling press. Perhaps you can see your way to advise such an idea in your columns. S. PERKINS.

TWO-STROKES AND SCOOTERS.

Sir,—Although the two-stroke has now been used for motor cycles for some years, practically no advance has been made in design. The Tilston engine, described in your issue of May 15th, is very ingenious, but it does away with the chief attraction of the two-stroke engine, viz., simplicity. Further, we know nothing of its performance.

In your next issue (May 22nd) there appears a full-page illustration of the Precision two-stroke. In this engine use is made of the magneto chain to circulate the oil, the oil well being at the bottom of the chain case. Let us hope that this will solve the lubrication difficulty, as everyone with experience of two-stroke engines knows that accurate lubrication is a *sine qua non*, a small error one way or the other resulting in overheating in the case of under-lubrication and misfiring in the case of over-lubrication.

Some time ago I wrote to your columns suggesting an oval exhaust port, as the corners of the present rectangular type get rapidly filled with carbon deposit. The idea is to do away with these dead angles, in order to reduce the rate of deposition. We hear of streamline carburettor passages; why not streamline ports in two-stroke engines?

It is a pity that the best makes of motor cycles fitted with two-stroke engines now cost about as much as those of the same class having four-stroke engines. When the air-cooled two-stroke commenced to boom, it was hailed as the "motor cycle for the million," but if it is to dispossess the four-stroke advantage will have to be taken of its simplicity to offer it at a much lower figure. Let us hope that manufacturers will direct their energies towards a large production of two-stroke lightweights instead of pandering to this ridiculous motor scooter craze. P. W. HAMPTON.

The Morgan on the road during the London-Edinburgh run. This particular machine was driven by Mr. H. F. S. Morgan, who, with the four other entrants, obtained a medal.

A HOME-MADE SCOOTER.

Sir,—I enclose two photographs of a home-made scooter which is made up from an Auto-wheel, and an extra road wheel and mudguard. The frame is a single aluminium casting, the gear is $8\frac{3}{4}$ to 1, and the drive is to the back wheel by a $\frac{7}{8}$ in. Renold chain. There are three rubber buffers incorporated in the rear sprocket, and these absorb much of the shock. Both wheels are sprung through a patent system of mine, and I find it very comfortable even on bad roads. The scooter climbs very well, and I have gone from Wolverhampton to Birmingham in fifty minutes non-stop,

A home-made scooter made by Mr. B. H. Bayliss.

and successfully climbed West Bromwich Hill without personally assisting. The average speed works out at over 5 m.p.h. over vile roads. My only trouble is broken mudguard stays. The mudguards are attached to the wheels (sprung), and so get a lot of jolting. I only made the scooter for use while overhauling my car, but have quite taken to it. I understand that many scooters have been made up of Auto-wheel sets. Will others kindly come forward with photographs and compare notes?

I am an advocate of "no seat." Hoping this will interest your readers,
B. H. BAYLISS, late R.A.F.

SPARE PARTS.

Sir,—I notice in *The Motor Cycle* numerous "growls" from readers who have difficulty in obtaining parts from makers of their machines, and that they also complain of inattention to correspondence, and also the "Don't care" style of reply when it does eventually arrive. I also notice that when a complaint of this kind is published the name of the offending firm is rarely mentioned. Why not? I certainly think that if these manufacturers knew that there was a chance of their being brought to task before 100,000 readers of *The Motor Cycle* (the majority of whom "devour" its pages from cover to cover—at least I do) it would give them "furiously to think," and might induce them to get a move on.

I should briefly like to mention my experience with regard to spare parts. I have a $3\frac{1}{2}$ h.p. 1914 Sunbeam which I bought three years ago second-hand and have used with sidecar ever since—winter and summer—over very hilly country. Last year, through my neglect in not adjusting the clutch rod, I broke two teeth off one of the cogs on the layshaft. With gloomy forebodings of a long spell of waiting, I posted the damaged part to the makers, with an amount which I thought would cover the cost, on a Thursday, and you can imagine my delighted surprise when I received the new part on the following Saturday morning and I was able to put it in myself and get on the road again without missing a journey. I have since written to them for trifling items not worth their bothering about but invariably get prompt delivery and a courteous reply.

I may state that the Sunbeam is going as strong as ever. Only recently we went to the moor over the usual hilly Devon roads, having wife (112 lb.) and daughter (70 lb.) in the sidecar, another daughter (95 lb.) on carrier, and myself (164 lb.) on the saddle. How is that for a five-year-old $3\frac{1}{2}$ h.p.? I was fortunate in not meeting an inspector of the N.S.P.C.A.

I have had many offers for the outfit, at considerably more than I paid three years ago, but although I have a good six-cylinder car, I cannot yet make up my mind to part with my sturdy silent Sunbeam.

In common fairness, I have pleasure in giving my experience, and advise my fellow readers to deal with those firms who do not lose interest in their products when sold or even when purchased second-hand.

Unfortunately, for me, usual disclaimer applies.

JOHN SCOBLE.

A TABLOID HISTORY OF AIR COOLING.

Sir,—I must apologise to "Pitot" for not answering his letter of May 15th earlier—I have only just seen it.

Opinions may differ as to the best method of comparing the petrol consumption of different engines. He dislikes bench test consumptions, and prefers gallons per hour in flight at altitude. His method, unfortunately, introduces variable factors, e.g., his selected rotaries are used on small scouts with minimum load, and his selected verticals, etc., on comparatively heavy two-seaters. I should question the soundness of this method. Even if an engine of each type, e.g., a Puma and a B.R.2, were both used on the same aeroplane, e.g., a Snipe, a variable would be introduced into the comparison, as the installations would modify the machine. For these reasons, if anybody asks which type of engine is the more economical, a bench test is the only reliable standard.

If "Pitot" prefers air consumptions, he has no right to juggle with his figures. His petrol consumptions are approximately correct, but his horse-power figures are grossly inaccurate. He lists the B.R.2 as 230 h.p., which is within 4 h.p. of its maximum output; but he quotes the Puma as also 230 h.p., which is 35 h.p. below its maximum!

Again, he takes an *obsolete* Vee, the R.A.F. 3a, and compares it with the two latest rotaries.

Since he says my figures are "hopelessly wrong," I beg to inform him that I went to the pains of having them checked by the statistical section at the Air Ministry. His phrase is therefore grotesque in any case: if he had been content to say "wrong," he would have had an excuse, for they happen to be based on the latest (and previously unpublished) returns from the factories concerned.

If, by terming the "radials" unproved, he means that they were not ready for service in France last year, he is, of course, correct. But "unproved" is a strong word to use when

- (1.) They hold most records for scout performances.
 - (2.) The 1919 R.A.F. contracts were what he and I know them to have been.
 - (3.) The pilots who have flown them think so highly of them
- TORQUE.

Motor Spirit Prices.

We are notified that the retail price of Pratt's Perfection spirit is 3s. 0½d. per gallon and that of Taxibus is 2s. 10½d. per gallon.

Stolen Machine.

A new A.J.S. and sidecar were stolen from a garage in Glasgow recently—frame No. 10903, sidecar No. 1990. The owner, Mr. H. Macdonald, 86, Vincent Street, Glasgow, would be grateful for any information.

Police Activity.

The police are very active at present in Oxford. The trapping commenced early last week, and there are already over fifty cases of exceeding the speed limit. It is hoped that this word of caution may save tourists being mulcted of the value of a good many gallons of petrol.

The Arbuthnot Trophy.

There is considerable keenness among motor cyclist officers in the Royal Navy concerning the Arbuthnot Trophy Trial which will take place in the Plymouth district on July 4th and 5th. It was thought at one time that officers living at a distance would have trouble in getting leave for the event, but as the competition appears in Admiralty Orders, and will appear on every ship's notice board, it does not seem as if there will be any difficulty in this respect.

Eliminating the Time Factor in Reliability Trials.

Undoubtedly trials organisers recognise the unpopularity of the secret check and speed-judging competition as means to find a winner in reliability trials, and when the South Birmingham Club holds its open trial on July 12th the sole aim will be to eliminate the alleged weaknesses of modern motor cycles. Excepting to ensure regularity of running, timing will play a small part in the conditions. The premier award is a trophy presented by the Palmer Tyre, Ltd., while there are several other cups which will be won outright.

A large entry is expected, and intending competitors should apply early for entry forms from the hon. sec., Mr. Ernest Boydell, 93, John Bright Street, Birmingham.

A Trial for Miniatures.

On July 26th the Sutton Coldfield and Mid-Warwickshire A.C., the organisers of the popular pre-war Colmore Cup trial, will hold a trial confined to lightweights. The premier award is a trophy value 100 guineas, and was last won in June, 1914, by P. Pike, on a 1.9 h.p. Levisette. The capacity limit has not yet been settled, but this will not in any case exceed 280 c.c.

Motor Cycles for Ex-soldiers—a Government Concession.

As announced in a leaderette last week, a special concession has been granted by the Government to the War Motors Association by which ex-motor cycle despatch riders, who have served as such in any branch of the Services, are to be given first refusal of a large number of surplus Government motor cycles. The only condition attached to the offer is that the motor cycles shall not be re-sold within six months. The following machines are available immediately: Several hundred new Douglas motor cycles, in crates, at from £60 to £70; a large number of repaired Douglas motor cycles at £40 to £50; and a quantity of repairable machines at various prices.

Application should be made in the first instance to the Secretary, Auto-Cycle Union, 83, Pall Mall, London, S.W.1, stating name of unit in which applicant served, and date of discharge.

The Metropolitan Police and Motor Cycles.

Mr. Frank Elliott, Assistant Commissioner of Metropolitan Police, has stated that the question of providing London policemen with motor cycles is under consideration. The idea, we are informed, is not to use motor cycle police for catching erring motorists, as is the case in the U.S.A., but merely to facilitate journeys between various points for policemen in the Metropolitan Police Force engaged upon their various duties. The matter is an interesting one, as Mr. Elliott is himself an old motor cyclist, and in 1904 or thereabouts used, for his own pleasure, a 2½ h.p. Kerry and trailer.

Winning a Pair of Gloves.

A sidecarist garaged his machine for three days at Bournemouth. After leaving, he found a pair of driving gloves in the sidecar. He reported the find to the garage without result. Will the owner communicate with us?

The Norton "Big 4" in the stopping and re-starting test, in which it demonstrated its reserve of power and fine acceleration. (See page 635).

GOLD MEDAL.

Birmingham—Land's End and Back

(605 miles double journey)

4 SUNBEAMS QUALIFY FOR THE TROPHY.

Edinburgh Motor Club's Sporting Trial.

Motor Cycling says:—"The half-day Trial held by the Edinburgh Motor Club was the most strenuous test that has ever been held in one day in Scotland. The results amply bear out this view. Sixty-two started and only nine reached the finish with clean sheets. Perhaps the $3\frac{1}{2}$ h.p. Sunbeam and sidecar made the most noteworthy performance in the trial, ascending all hills in fine style and being up to time at all checks."

These facts speak volumes for the power of the Sunbeam Engine and the Perfection of the Sunbeam Oil Bath Chain Transmission.

JOHN MARSTON Limited, 11, Sunbeamland, Wolverhampton.

London: 57, Holborn Viaduct, E.C.1.—157, Sloane Street, S.W.1.

Nottingham Trial.

The trial for the Dennis Bayley challenge cup was run off by the Nottingham and District Motor Cycle Club on Saturday last, with the following results: Winner, S. S. Debenham (8 Champion); gold medal, R. McPherson (Rudge-Multi).

Atlantic Flight Hero.

On Saturday evening Capt. Sir J. Alcock was a guest at an informal dinner given by the Bristol club. The Lord Mayor was in the chair, and in a short speech he referred to the manner in which Sir John had set out to face the unknown, the same as had Sebastian Cabot, who sailed from the port of Bristol in 1497, and discovered the mainland of North America.

The Sheffield-Holyhead Trial.

Only nine members of the Sheffield and Hallamshire Club competed last Saturday in the trial to Holyhead and back for the Hilton Shield. The roads were good, and on the whole the machines ran well. The following finished: S. Sawyer (4 Norton sc.), E. H. W. Hoyland (4 Norton sc.), J. Haslam (4 Douglas sc.), D. Kaye (4 Triumph), F. James (8-10 Morgan), and A. Blake (8-10 Morgan).

The Arbutnot Trophy.

The Motor Cycling Club has decided to offer a prize for the best performance of the rider of a solo machine in the Arbutnot Trophy competition, run by the Auto-Cycle Union.

It is extremely gratifying to see that the M.C.C. is paying this tribute to the memory of its late distinguished member, who took so keen an interest in the club's competitions. The entrants so far are as follow:

1. Sub-Lt. G. F. N. Tollock, R.N. (8 Harley-Davidson)
2. Maj. W. Patrick Arbutnot, R.M.L.I. (6 Enfield)
3. Sub-Lt. R. N. Everett, R.N. (4 Triumph)
4. Lt. C. F. H. Marriott, R.N. (4½ B.S.A.)
5. Lt.-Com. T. F. C. Phillips, R.N. (A.J.S.)
6. Lt. R. C. Hovenden, R.N. (Norton)
7. Lt. S. E. P. Hutton, R.N. (Rudge Multi)
8. Lt. Victor Bellord, R.N. (Triumph)
9. Lt. Dennis H. Griffiths, R.N. (Norton)
10. Lt. Terence H. Back, R.N. (Triumph)
11. Lt. C. J. M. Samuelson, R.N. (Levis)
12. Lt. W. W. Jacob, R.N. (5-6 James)
13. Sub-Lt. W. F. Jameson, R.N. (—)
14. Lt. E. S. K. Evans-Greaves, R.N. (4 Triumph)
15. Sub-Lt. G. P. Glen-Kidston, R.N. (3½ Sunbeam)
16. Lt. W. Derek Stephens, R.N. (3½ Douglas)
17. Sub-Lt. C. P. Laurie, R.N. (P. and M.)

Junior Car Club Hill-climb.

The Junior Car Club held a most successful competition at South Harting on Saturday. The most interesting machine present was Capt. Nash's racing G.N., the aluminium body of which was the true Brooklands type.

Class 1, for three-wheelers of 1,100 c.c., was a walk-over for F. J. Findon on an 8 Morgan. In Class 2, Capt. Nash gained a first on time, with the G.N.'s of C. Finch, and Capt. Ogilvie second and third.

Class 6, for racing three-wheelers of 1,100 c.c. saw Major A. C. Hardy's 8 h.p. G. P. Morgan first, with F. G. Layzell second.

Class 7, for racing cars up to 1,100 c.c., was won easily by Capt. Nash on the G.N. both on time and formula, while on time H. R. Godfrey was second on a G.N., the two A.V.'s making good climbs.

The last racing class for machines up to 1,500 c.c. went to Godfrey's G.N. on time,

The Purchase of Motor Cycles by the War Office, 1914-1918.

The following is the number of motor cycles purchased by the Government from the beginning of the war up to September 30th, 1918:

SOLOS.			
Triumph	6,290
Douglas	6,998
Clyno...	191
Enfield	14
Rudge	141
Zenith	220
			13,854
SIDE CAR OUTFITS.			
Douglas	1,180
Clyno...	733
B.S.A.	546
			2,459

The figures have reached us from the Assistant Director of Mechanical Transport at the War Office, and do not include the P. and M.'s of the Flying Corps.

Average Prices.

Three more Government sales were conducted last week by Messrs. Goddard and Smith on Tuesday, June 17th, Thursday, June 19th, and Friday, June 20th, respectively at the Agricultural Hall, Islington.

The surplus Army machines offered for sale during the week consisted of a large number of new 2½ h.p. Douglasses, a smaller number of old machines, both 2½ h.p. and 4 h.p. of the same make, in various stages of decay, and many war-worn 4 h.p. Triumph motor cycles. New 2½ h.p. Douglas machines fetched sixty-seven guineas, sixty-eight guineas, and sixty-nine guineas. The old 2½ h.p. Douglas machines were in various stages of wear, and the prices realised for them differed accordingly, being forty guineas, thirty guineas, and nineteen guineas.

The 4 h.p. Douglasses realised from

forty guineas to forty-five guineas for the better machines, thirty guineas, and from twelve guineas to twenty-two guineas being paid for the second and third-class mounts.

The 4 h.p. W.D. pattern Triumphs produced keen competition, and realised an average price of forty-eight guineas.

The War Motors Association.

WE recently had an interesting conversation with Captain W. B. Shepherd, M.C., organising secretary of the War Motors Association, 240, High Holborn, London, W.C.2. The *raison d'être* of this Association was dealt with in an editorial in last week's issue, which, we may remind our readers, is for fulfilling the important duty of rendering it possible for ex-soldiers and sailors, whether officers or men, to purchase Government motor cycles at a reasonable figure.

For this purpose the Government has allotted a certain proportion of the motor cycles it has for disposal. The first consideration will be given to the man who needs a motor cycle in business. To purchase a motor cycle he must make application through the secretary of the Auto Cycle Union, 83, Pall Mall, London, S.W.1, and must present his discharge papers as a sign of *bona-fides*. People who have received grants from the King's Fund for Disabled Men, or those who have received other Government grants, will be glad to avail themselves of the facilities offered. The War Association saves a man from going to an auction or a dealer to buy a machine, as it has been found that at the average auction a ring of buyers is frequently encountered, which do not allow the ordinary individual a chance of obtaining a machine at a reasonable figure.

Capt. Shepherd is himself a motor cyclist, and has the interest of the ex-Service motor cyclist thoroughly at heart.

Glasgow M.C.C. Gymkhana held last Saturday before a large crowd. H. G. Deas (2½ h.p. New Hudson) and R. H. Lockhead (2½ h.p. New Imperial) in the "belt" competition.

A WEST-COUNTRY RALLY.

Bristol entertains A.C.U. Committee.

Inspection of the Douglas Works.

Successful Gymkhana at Ashton Court.

IF justification were needed for the new policy of the A.C.U. in holding its meetings at different centres, the success of the Bristol meeting provides it. At no time has the Auto Cycle Union had such a well attended committee meeting—nor such a representative one. This was held last Friday, and to it members of the committee journeyed from as far North as Sunderland, and from London, Liverpool, Manchester, Birmingham, Coventry, and other centres in order to represent their "constituents" at the motor cyclists' parliament.

The committee meeting was held in camera, but it was obvious to the most casual observer that a new enthusiasm animated the A.C.U. committeemen who invaded the Grand Hotel.

As frequently pointed out in *The Motor Cycle*, provincial motor cyclists before the war regarded the A.C.U. as a London organisation run by Londoners for Londoners. This feeling has changed. The A.C.U. is now regarded as a national institution, and in truth becomes the motor cyclists' parliament, representing 32,000 riders who support it, and considerably over a further hundred thousand who do not.

Large as is the present number of members, half of whom have joined this year, it should be larger, and without doubt such events as that which we attended last week at Bristol will go a long way toward securing the support of those who at present allow others to fight their battles for them.

Lavish Hospitality of Bristol.

Bristol has always been a hospitable city. The committee of the A.C.U. knew this before their visit, but it is doubtful whether any one of the visitors expected quite such a hearty welcome as that arranged for them by the Bristol Motor Cycle Club.

The interest of the public in motor cycles was exemplified at Bristol last Saturday, when the A.C.U. committee were entertained by the West of England club.

At nine o'clock on Saturday morning over forty Douglas sidcar outfits were lined up before the hotel entrance. Each was numbered, and delegates and pressmen were allocated machines, which they were to regard as their vehicles for the day. These machines were driven by members of the club, officials of the Douglas works, and Douglas testers, and were, with one exception, standard 4 h.p. models.

At 9.30 a.m. the long line of machines moved off in single file, and threaded its way through the traffic of the narrow crowded streets of the city to the Douglas works at Kingswood. Here they were met by the principal of the famous Bristol firm, who, to emphasise the hospitality of his city, threw open the works for inspection.

There was more than hospitality in this share of the city's welcome to the visitors. Among the delegates were the heads and designers of several contemporary firms, and this broad-minded action on the part of Messrs. Douglas Motors, Ltd., set a precedent of what, in future years, may become general practice. It was exceedingly pleasing to us to see this whole-hearted invitation to all interested in the development of the motor cycle, for such visits must ultimately be of great benefit to all concerned in the production of motor cycles in particular, and to the field of British engineering generally.

The visitors were piloted through the works in parties by the works manager, and were shown Douglas motor cycles in every stage of construction. The works

Four companies of the 1st Motor Battalion, Machine Gun Corps, at attention in the Bristol Rally.

The Gymkhana at Ashton Court Park. (Left) A competitor in the "long jump" competition. (Right) Tilting the ring.

have been greatly extended during the war, and equipped with magnificent plant.

After the tour of inspection, it was suggested that it would be fitting to take away as a memento one of the hundreds of machines which had been inspected, and two energetic committeemen immediately interviewed the sales manager, Mr. Rossiter, with whom terms were arranged. A new 2½ h.p. model was brought out of the stock room to be "raffled," and the long queue obtaining tickets rivalled that for a "first night."

The Official Luncheon.

The Lord Mayor of Bristol (H. W. Twiggs, Esq.) with his chain of office now arrived in his state carriage, with footmen in scarlet livery, and was received by Mr. W. Douglas, sen., who made the usual introductions. The party were then conducted to one of the large mess rooms and entertained to lunch by Douglas Motors, Ltd., after which came the usual speeches, when the Lord Mayor referred to the present and potential popularity of the motor cycle, paying tribute to the A.C.U. and all motor cyclists for their share in developing the machine. The war, he said, had been won by the internal combustion engine.

Mr. W. Douglas, sen., Mr. J. R. Nisbet (chairman of the A.C.U.), Mr. T. W. Loughborough (the secretary of the A.C.U.), Capt. Philip Grout (the captain of the Bristol M.C.C.), Mr. S. L. Bailey, and others also spoke.

The function terminated with the Lord Mayor drawing the prize winner in the raffle. Amid silence this was done, and the name read out was that of Mr. E. B. Ware, of J.A.P. engine fame.

The afternoon part of the programme commenced with a return in the Douglas sidecar convoy to the city, where, at College Green, the visitors were met by the local motor cyclists. Before the cathedral four companies of the Motor Machine Gun Corps stood at attention. This company, commanded by Maj. B. Arthur, D.S.O., consisted of eight Clyno sidecar gun carriages, mounted with Vickers machine guns, eight spare carriages, eight ammunition carriages,

four section officers, and four scouts mounted on 1916 4 h.p. Triumphs.

The Bristol club officials now led the way to Clifton Downs, and the long line of motor cycles with the machine guns practically encircled the Downs, where they exemplified the utility of the motor cycle in peace and war.

No more charming a spot can be imagined than the sea wall at Clifton Downs. In brilliant sunshine the visitors disembarked to admire the scene, and after a short stay proceeded across Clifton Suspension Bridge to the beautiful Ashton Court Park for the gymkhana. Here several hundred other motor cyclists welcomed the party, and the sports commenced. The events included a slow race, tilting the ring, musical chairs, long jump, and obstacle race, after which the Motor Machine Guns gave an interesting display. The winners of the various events are as follow:

- SLOW RACE**
1. H. Thorpe (Douglas).
2. G. F. Tozer (2½ G.K.).

MUSICAL CHAIRS.

1. A. Phipps (4 Douglas), Miss Tozer passenger.
2. Mr. and Mrs. Howell (5 Brough sc.).

LONG JUMP.

1. Lt. Bradshawe (4 Triumph), 27ft.

OBSTACLE RACE (Solo).

1. Lt. Bradshawe (4 Triumph).
2. E. G. Ferry (2½ Douglas).

SIDECARS.

1. W. King-Smith (8 Harley-Davidson).
2. Rex Mundy (8 Matchless).

The arrival of Capt. Sir John Alcock, fresh from his investiture, in a Douglas light car, was the signal for a general rush to the Lord Mayor's carriage, where for a moment he was seen receiving his lordship's congratulations. After that he was lost in a surging crowd of admirers.

Altogether the Bristol M.C.C. are to be congratulated upon the splendid organisation which permitted them so thoroughly to entertain the A.C.U. Every credit is due to Messrs. S. L. Bailey, J. Cates, and A. Tozer, who were responsible for an event which has set a difficult standard for other centres to follow—and, incidentally, given the A.C.U.—and consequently the pastime generally—a filip which is bound to have a beneficial effect.

THE
BRISTOL
RALLY.

The A.C.U. committee in a convoy of Douglas sidecars.

A Sporting Trial in Scotland.

A Successful Competition of an Unusually Severe Nature. Of Sixty-four Starters only Eleven Finished.

THOUGH stated not to be a freak course, the route chosen by the Edinburgh M.C. for its recent trial was particularly severe.

The course consisted of close upon ninety miles over mountainous country—creating at first a happy impression, which rapidly receded as the day advanced. The last sixty miles left an impression of watersplashes, hairpin bends, steep gradients, loose sandy surfaces, gates, rocks, and countless observers. There were seven observed hills, and each one took its toll, so that when once the wild country was struck the weeding-out process proceeded very rapidly. The entries included many novices—one lady rider of a 3 h.p. Enfield and several school boys, who certainly made up in keenness what they lacked in experience.

The first observed hill was at Dunsin, a steep gradient in a wooded valley, and quite invisible till, coming round a blind corner, one finds oneself confronted by the ascent. Though not very long, the worst gradient is about 1 in 4, and is met, as is general, at a difficult corner. Here, C. R. Duncan (2½ Douglas), J. Beck (3½ Sunbeam sc.), C. S. Burnley (4 Blackburn), Arkman Smith (3½ Scott), C. Lawson (4½ B.S.A.), J. W. Hutchinson (7-9 Harley sc.), J. R. Alexander (6 Enfield), W. S. Miller (3½ P. and M.), and Wm. Frayeur (8 Sunbeam sc.), all made excellent ascents, while A. W. Beaton (8 Matchless sc.) took the hill at exceedingly high speed—too fast for reliability. H. G. Walker (3½ New Hudson) stopped, but made a good restart; while C. C. Mitchell (6 Enfield sc.), T. K. Bonnar (3½ single-speed Triumph), and J. W. McFarlane (3½ Norton), “konked out.” P. Douglas (7-9 Indian sc.) failed early in the ascent, and caused some excitement by running backwards and capping his outfit, the sidecar emptying its contents—a tea basket and tools—on the head of the ejected passenger.

Among the Hills.

The hills now came into view, and, after two difficult water splashes, Redstone Rig, one of the most difficult hills of the day, was approached. It is a hill of rather over a mile in length, gradually becoming steeper and looser till, at the crisis, two difficult corners are struck. At the top of the hill was located the first check, so that those ahead of time had an opportunity of cooling before tackling the gradient. Being unfamiliar with the course, however, few were able to profit by possibilities of this kind.

Redstone Rig.

Having watched most of the competitors mount at Dunsin, we managed to arrive at Redstone Rig to observe the tail end of the procession. Frank Smith,

Edinburgh M.C.C. open trial. Despatching competitors after tea from the check on Snout Hill.

piloting his Clyno outfit, came crawling silently up the worst part of the gradient, murmuring that he was ahead of time and enquiring as to the position of the check! R. Boyack (7-9 Bat) made an exceedingly fast ascent—a performance he repeated on all the open hills. J. Johnson (4½ B.S.A. sc.) climbed well, as also did Duncan Bell (6 A.J.S. sc.), A. Bonvill (2½ A.J.S.), and J. Madden (6 A.J.S.), J. H. Balfour (4 Norton), and A. L. Clark (4 Triumph). Hutchinson (Harley sc.) was baulked, but restarted well; Grinley (New Hudson) was also baulked. H. Alexander (4 Douglas sc.) made a fast and silent ascent of all hills.

The succeeding twenty miles, via Gartvald, Stenton, Pilcox, Spott, and Elmsleuch presented many trials in the way of surface and corners, and the competitors experienced much difficulty in holding their 20 m.p.h. average. There were a few spills, but nothing very serious.

Rapid Elimination.

There followed two observed hills in quick succession, namely, Elmsleuch and Crickness, the latter being the East Lothian test-hill, immediately after which the non-stop section began, terminating at the tea control.

The next check and control was at the summit of Snout Hill (observed), a breezy upland spot, where tea was taken, and where many motorists were present. This hill begins with a watersplash, and is of considerable length, and of exceedingly difficult gradient and surface. J. R. Alexander (6 Enfield sc.), A. B. Bruce (6 A.J.S. sc.), A. H. Alexander (3½ Douglas)—who, by the way, is enthusiastic as to the properties of the Douglas spring frame—all did exceedingly well; while the Bat riders and Beaton (8 Matchless sc.) again came up at speed.

After tea the process of elimination proceeded very rapidly. Continuing to Donnally Burn we found Arkman Smith (3½ Scott) emerging from a collision with one of the sidecars. His frame was badly twisted and his low gear rendered inoperative, which was hard lines, since he had ridden well; but he pluckily finished the event.

Reservoir Hill and Slade Hill were more by way of being driving tests than anything, both containing hidden hairpins on their steepest and loosest portions, and the last named accounted for no fewer than

sixteen failures among the few survivors! We noticed one Harley-Davidson travelling at speed with a broken sidecar coupling, while another, in the midst of a fine ascent, suddenly stopped down with gear box trouble—apparently seizure. Several riders crashed on one or the other of these hills, and so spoilt their sheets, after which came a clean straight run back to Siberton.

The following competitors got through without loss of marks—truly a worthy performance:

Jas. Beck (3½ Sunbeam sc.)
C. S. Burnley (4 Blackburn).
W. B. Fenwick (6 Rover sc.)
W. S. Miller (3½ P. and M.)
J. R. Alexander (6 Enfield sc.)
A. B. Bruce (6 A.J.S. sc.)
A. H. Alexander (3½ Douglas).
J. Armstrong (8 Enfield sc.)
Duncan Bell (6 A.J.S. sc.)
J. W. Anderson (8 Bat sc.)
Frank Smith (8 Clyno sc.)

It will be observed that only three solo riders out of thirty and eight sidecars out of thirty-one are mentioned. All the survivors surmounted very great difficulties, but Beck (3½ Sunbeam sc.) and Burnley (4 Blackburne) undoubtedly put up the surprise performances of the day. They held Nos. 1 and 2, and kept together dead on time throughout the event.

In addition to the ordinary medals, the Palmer Tyre, Ltd., is presenting a pair of tyres for the best performance by a competitor who has not previously competed in any event.

The organisation of the event was excellent throughout, and Messrs. Macrae and Hutchinson, with whom the responsibility mainly rests, are certainly to be congratulated on the results. The weather was perfect, and the whole event proved most enjoyable and interesting.

SCOTTISH SIX DAYS TRIALS THIS YEAR.

AT the beginning of the week a wire reached us to the effect that the Scottish Six Days Motor Cycle Trials will be revived next month. The date selected is July 21st to 26th, and the conditions governing the trials, as well as the route, remain approximately the same as in 1914. The Edinburgh and District Motor Club is, of course, the organising club, and Mr. Campbell McGregor, 6, Castle Terrace, Edinburgh, has the arrangements in hand.

**Liverpool M.C.**

The speed trials at Colwyn Bay announced for July 12th have been postponed.

Launceston M.C.C.

All motor cyclists residing in the district round Launceston interested in the formation of a motor cycle club should communicate with Mr. Maurice Prout, Creathorne, Launceston.

Western M.C.C. (Glasgow).

With the exception of the results of Class 2, the first and second place winners given in last week's issue have been confirmed by the committee. Class 2 results are: 1, W. Deans (3½ h.p. Ariel), figure of merit 181; 2, J. Spence (4 h.p. A.J.S.), 172.

South Birmingham M.C.C.

It will be recalled that the winners in the recent South Birmingham M.C.C. trial were first announced as: 1, L. Newey; 2, G. Dalby; 3, T. Stevens. Then, owing to a protest, the positions were altered to: 1, T. Stevens; 2, L. Newey; 3, G. Dalby. We understand the protest was not upheld by the committee, and that the positions of the first three are as originally announced:

1. L. Newey (3½ Ariel).
2. G. Dalby (4 Triumph).
3. T. Stevens (4¼ James sc.)

Larne and District M.C.C.

The first social run of the above club was held on Saturday, June 14th. A start was made from the Laharna Hotel, the destination being Ballymena and Carnlough. There was a good turnout of members, the sidecarists, as usual, being in the majority.

It is hoped by the members that the enterprising secretary and captain will arrange for many similar runs during the summer months and that all motor cyclists in Larne and district will take advantage of these social runs.

The best thanks of the club members are due to Mr. Cameron, the father of motorising in Ballymena and district, for his advice regarding the running of the club.

North Cheshire M.C.C.

It has been arranged that the opening run of the above club shall take place on the 29th, at 2-15 p.m. sharp, meeting place Trafford Hotel, Alderley. A social run to Rudyard Lake has been planned, where tea and boating have been arranged for. It is hoped there will be a large attendance—all motorists are cordially invited. There is a trophy for the smartest "turnout." The hon. sec., Mr. W. R. Eadington, London Road, Alderley Edge, will be pleased if all intending to be present will notify him as to the number of seats they require for tea, weather permitting.

Future Events.

JUNE 27-28.—LIVERPOOL M.C. TWENTY-FOUR HOUR TRIAL TO EDINBURGH.
JUNE 28.—York and District M.C. Week-end Run to Bridlington.

JUNE 28.—BIRMINGHAM M.C.C. SPEED TRIALS.

JUNE 28.—LIVERPOOL M.C. TWENTY-FOUR HOUR TRIAL TO EDINBURGH.

JUNE 28.—M.C.U. OF IRELAND, ULSTER CENTRE, RELIABILITY RUN.

JUNE 28.—MIDLAND C. AND A.C. RELIABILITY TRIAL.

JUNE 28.—Western M.C.C., Glasgow. Old Crook Test.

JUNE 29.—N.M.C.F.U., Leeds. Run to Malham-Skipton.

JUNE 29.—Rochester, Chatham, and District M.C. Inter-club Meet with Woolwich and Streatham Clubs.

JUNE 29.—N.M.C.F.U. (Wolverhampton). Social Run to Milford, near Stafford.

JUNE 29.—Taunton and District M.C.C. Run to Cheddar.

JUNE 29.—Essex M.C. Picnic on Dunstable Downs.

JUNE 29.—Ilkerton and District M.C.C. Run to Dovedale.

JUNE 29.—S. Birmingham M.C.C. Run to Tewkesbury.

JUNE 29.—Eastern Counties M.C. Run through Hertfordshire Lanes.

JUNE 29.—N.M.C.F.U., Sheffield. Week-end Run to Bridlington.

JULY.—MIDDLESBROUGH AND DISTRICT M.C.C. 200 MILES RELIABILITY TRIAL FOR GJERS AND NEW HUDSON CUPS.

JULY 2.—MIDDLESBROUGH AND DISTRICT M.C.C. RELIABILITY TRIAL FOR GJERS CUP.

JULY 3.—Taunton and District M.C.C. Reliability Trial.

JULY 4.—5.—ARBUTHNOT TROPHY TWO DAYS TRIAL, PLYMOUTH DISTRICT.

JULY 5.—M.C.C. Hill-climb.

JULY 5.—Birmingham M.C.C. Social Tour.

JULY 5.—Streatham and District M.C.C. Members' Reliability Trial.

JULY 5.—Wolverhampton M.C.C. Half-day Reliability Trial.

JULY 6.—Wolwich, Plumstead and District M.C. Picnic Run to Toy's Hill.

JULY 6.—Western M.C.C., Glasgow. Run to Clovenfords.

JULY 6.—Nottingham and District M.C.C. Inter-club Run with E. Midland Associated Clubs.

JULY 6.—OLDHAM AND DISTRICT M.C. RELIABILITY TRIAL.

JULY 12.—LIVERPOOL M.C. RACES AT COLWYN RAY.

JULY 12.—WOLVERHAMPTON M.C.C. OPEN TRIAL.

JULY 12.—Motor Cycling Club. "Touch Nothing" Run.

JULY 12.—Western M.C.C. Team Trial.

JULY 12.—SOUTH BIRMINGHAM M.C.C. OPEN TRIAL.

JULY 12.—Motor Cycling Club. Hill-climb.

JULY 13.—Wolverhampton M.C.C. Social Run to Stratford-on-Avon.

JULY 13.—M.C.U. OF IRELAND, ULSTER CENTRE, IRISH END-TO-END RELIABILITY RUN.

JULY 16.—York and District M.C. Reliability Trial.

JULY 19.—Middlesbrough and District M.C.C. Sidecar Competition.

JULY 19.—Sutton Coldfield and Mid-Warwickshire A.C. Open Hill-climb at Stile Cop, near Rugby.

JULY 19.—BIRMINGHAM M.C.C. MIDLAND CUP TRIAL.

JULY 20.—Nottingham and District M.C.C. Run to Donnington.

JULY 23.—ESSEX M.C. SPEED TRIALS AT SOUTHEAST.

JULY 23.—ESSEX M.C. SPEED TRIALS WESTCLIFF-ON-SEA.

JULY 26.—Sutton Coldfield and Mid-Warwickshire A.C. Lightweight Trial for Calthorpe Cup.

JULY 27.—Streatham and District M.C.C. Picnic Run to Ashdown Forest.

AUG. 16.—S.E. COUNTIES INTER-TEAM TRIAL.

SEPT. 5.—M.C.C. TEAM TRIAL FOR "THE MOTOR CYCLE" CUP.

SEPT. 15-20.—A.C.U. SIX DAYS RELIABILITY TRIALS.

Manchester Wheelers.

There will be an obstacle race for motor cycles included in the programme of the Manchester Wheelers 32nd race meet at Fallowfield on July 12th. Motor cyclists desirous of entering should apply to the race meet hon. secretary, Mr. F. T. Guildford, at the Clubhouse, South King Street, Manchester.

Camberley and District M.C.C.

After four years of enforced suspension an effort is being made to revive the Camberley and District Motor Cycle Club. Any old member, or others, desirous of joining should communicate with the hon. secretary, Capt. W. J. King, "Peveril," Lower Gordon Road, Camberley.

Shetfield and Hallamshire M.C.C.

The members of the above club recently met at Cowdale, Ashwood Dale, near Buxton, for a weight-carrying competition up the A.C.U. 1914 freak hill. A fair number turned up, and a very keen contest took place, the loads being composed of men and boys. The final three were G. W. Wilkins (5 h.p. Brough) carried five men; B. H. Eccles (4 h.p. Norton), four men and one boy; — Goulding (4 h.p. Douglas), four men.

The First Post-war Speed Trials.

On July 23rd the Essex Motor Club will hold their speed trials at Westcliff-on-Sea. There will be two principal events, i.e., one kilometre flying start and the one kilometre standing start, and in addition to car classes there are no fewer than eighteen types of motor cycles catered for.

"Standard touring machines" must be as per manufacturers' published price lists, except that wide or dropped handle-bars will be permitted. Lamps need not be fitted, but toolbags with tools and motor cycle horn must be carried.

In all passenger classes the weight of the passenger must not be less than 132 lb.

A first prize is offered in each class, also a second prize if eight or more entries are received, and a third if twelve or more entries are forthcoming. A special prize is offered for the winner of a match between the fastest motor cycle and the fastest car.

Entries, which close on July 8th, should be forwarded to the hon. organising secretary, Mr. Harved Fuller, 51, Pulteney Road, South Woodford, E.18, who will forward entry forms upon request. The fees are as follow:

Members, 7s. 6d. each class; five for 30s.

Non-members, 15s. each class; five for 60s.

Membership of the club is: Entry fee, 7s. 6d.; subscription, 12s. 6d.

NO AGE LIMIT.

Second Batch of Letters received from Readers of Mature Years.

IN last week's issue we gave several letters from motor cyclists of mature years, and here we print several more. In addition, we have received a large number of letters from riders with slightly fewer years to their credit, which may be published at a later date.

So far, the published record is as below:

The Rev. E. W. Wilmott, age 72

"An Irish Canon," age 72.

Mr. J. R. Marsh, age 70.

Mr. W. Crooke, age, 67.

Among this week's letters there are communications from three old-young riders of 75, 77, and 68 years of age, who enjoy all the pleasures of the side-car and solo mount.

Mr. R. Wolstenholme (age 77).

Mr. Jas. Scott (age 75) prefers a single gear clutchless 2½ h.p. Calcott, and Mr. R. Wolstenholme, of Blackburn, who is 77, also uses a solo machine.

The next reader in order of age is Mr. Richard Wolstenholme, who says:

"In the spring of 1916, after my seventy-fourth birthday, I bought a 2½ h.p. Douglas, and one Sunday morning I went out to learn to ride it. After one hour's lesson I rode it home, a distance of four miles. My longest ride in one day on the Douglas was 135 miles, which I did on just over a gallon of petrol.

"I am now the owner of a Bayliss and Thomas 4½ h.p. Excelsior, and was seventy-seven years of age on the 15th of March last, and I enjoy a good spin as well as a lad of twenty. I attribute

my good health and long life largely to the use I have made of the cycle as a means of going about the country and getting out into the fresh air.

"I may not be the oldest in age of any motor cyclist in the country, but if I am not, there will not be very many to heat me, and I should like to exchange photographs with them, if there are any older riders than I am."

A single-gear enthusiast, at the age of seventy-five, is Mr. Jas. Scott, of Insch, Aberdeenshire, who, in sending his photograph, gives a brief account of his experiences:

"In your issue of June 5th you invite photographs and experiences of young old motor cyclists. I herewith enclose photograph of self and my trusty 2½ h.p. Calcott fixed gear: no free engine. This machine has carried me a good few thousand miles without giving me any trouble, and no experiences other than pleasure.

"I have had a few falls on ice in winter, and a farmer's dog once ran in front of me and gave me a nasty fall, but the only damage was a bent footrest, so I mounted and rode off again.

"I am in my seventy-fifth year, and have been a motorist for the last eight years. I shall be very pleased to hear of a 'young-older' motorist."

Mr. F. G. Hillyer, of Northampton, is another "young-old" motor cyclist, who began cycling in the days of the "bone-shaker," but he now prefers a 6 h.p. Enfield combination, upon which he undertakes quite long journeys. He was sixty-eight years of age in May last. "I commenced cycling at the age of sixteen," he writes, "my first machine being the old 'bone-shaker,' and I have been a keen cyclist for years, changing machines according to times. Forsaking the push bicycle in 1910 I became a motorist in

1914 on a Rex machine, changing for a Royal Enfield in 1916. With usual load of three adults I enjoy long rides. Sunday last, I rode to Tottenham, London, and reached there, after 3½ hours run, at 10 a.m.; left at 3 p.m. for Harrow,

Mr. J. Scott
(age 75).

arriving there at 4.30 p.m. The homeward journey commenced at 6 p.m., and I arrived at Northampton safely at 10 p.m. I am able to do all running repairs, and am ready to lend a hand to others on the road whose luck runs out. I had a bit of a spill in 1917 coming from Leicester, turned somersault, and kindly tipped occupant of Tansad back seat into the hedge, and myself somewhere on the road. After slight attention to all three of us, we resumed our seats and finished the nineteen miles for home. After a week's rest I was fit for riding, and have kept so ever since. I expect to go to London again on June 29th. As a long and interested reader of your paper I wish you every success in the future."

Mr. F. G. Hillyer (age 68).

QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Fitting a Magneto.

Q. I have a 5-6 h.p. Riley tricar, single-cylinder two-cycle engine with accumulator ignition. As the accumulators are so inconvenient, I should like to substitute a magneto. Could you kindly tell me what magnetos would suit my purpose? Would it require gearing up at all; if so, what proportion?—B.H.H.

The Riley tricar was never made with a two-stroke cycle engine. It is a four-stroke. You can fix any single-cylinder magneto which will require to be driven at half the engine speed.

Loss of Power.

Q. My engine is a $4\frac{1}{2}$ h.p. Precision running on benzole, and until recently it would take a sidecar and passenger up a good long hill on top gear. Now on opening the throttle the engine will not accelerate and loses power, and on a hill which I could take on top gear easily I now have to change into second gear about halfway up. The engine will take full air, and has developed this trouble suddenly.—J.A.

It is curious that the engine should have developed the trouble suddenly, and it seems as if it were due to a large amount of carbon deposit. The cylinder therefore should be removed and all carbon deposit scraped from the cylinder head and piston; the valves should be ground in, and new valve springs fitted if their tension appears to have been lost. Try changing your plug, and see if the jet is clear.

Running a Douglas.

Q. My machine is a 1914 $2\frac{3}{4}$ h.p. two-speed Douglas. (1.) Should I give the engine a charge of oil every five or every eight miles (drip feed)? (2.) When taking the machine out, does it require a charge of oil before starting? (3.) The sight feed glass fits the grooves on each side, but oil drips over the plug. How can I remedy this? (4.) How much oil does the gear box require? (5.) Apart from tools, what essential spares should I carry? (6.) How shall I drain the engine of dirty oil?—R.W.W.

(1.) You should set your drip feed so that it uses one pumpful of oil every half hour. (2.) No. (3.) If the oil leaks from the sight feed chamber, new washers are perhaps required. (4.) One pumpful of grease for every 300 miles. (5.) It would be as well to take a spare plug, inner tube, a chain, belt, and tyre repair outfit. (6.) There is a drain tap underneath the crank case.

Advice on an Old Stager.

Q. I have an old Minerva motor cycle with battery and coil ignition, and the spark advance control on the side of the tank. (1.) Please tell me the reason why the pear-shaped plate which carries the make and break is linked up with a cam that can be used to lift the exhaust valve? The rod between the bell crank on the tank and the pear-shaped plate was missing when the motor bicycle was bought, and I am in doubt about the length I must make the new one. (2.) Can I get new valve caps for these old engines, and where? (3.) What are the electrical connections?—J.H.

(1.) The arrangement you refer to was introduced for the purpose of raising the exhaust valve before the time that the exhaust valve lifters were fitted with Bowden handle-bar control. The method of starting was to retard the spark fully, run alongside the machine, then mount, when the valve was dropped and the engine fired. There should be no difficulty in fitting a new rod. It is quite easy to measure the length of the rod required, and we are afraid that this is a matter in which we cannot help you without seeing the machine. (2.) It might be just possible to get a new valve for this engine from the Minerva Repairs Department, Chenies Street, London, W.C. (3.) The electrical connections are as follow: P on the coil to the positive terminal of accumulator; negative of accumulator to switch; B on coil to the sparking plug; C on coil to contact breaker; M on coil to frame.

Electric Conversion.

Q. I wish to run a head and tail lamp off the magneto. (1.) Where do I get my connections on the magneto? (2.) Which do you advise—to run lamps in parallel or in series? (3.) Will the current be sufficient to give an efficient head light at ordinary speeds? (4.) Give approximate voltage and ampère of the primary winding of magneto running at normal speed.—P.L.

Before adopting the scheme you suggest, we should advise you to consider the alternative plan of obtaining a small accumulator, say, twenty ampère hours capacity, and running your head and tail lamps from it in parallel. You would get a better light, which would be constant and quite independent of the engine speed and available when the machine is stationary. The only objection is having to get the accumulator charged up separately which is very easy in the case of such a small cell. If you determine to try the other plan, we recommend you to fit one of the transformer coils supplied by Messrs. F.R.S. Lamps, Ltd., Pershore Road, Birmingham. They are made specially for the purpose, and bring the voltage down to four, so that lamps may be wired from it in parallel. Although the primary winding of a magneto when running "open" will give, say, two ampères at four volts, the voltage in actual use is considerably higher on account of the self induction of the primary when the contact breaker opens, consequently this is not suitable for connecting directly to the lamps.

A sidecar of French design, produced by Mr. Geo. Levey, Paris, and marketed by Messrs. Robertsons, Great Portland Street, London.

Guarantee.

? I purchased a motor cycle through an advertisement in *The Motor Cycle*, and went to see the machine and the seller, and when we came to terms he gave me a receipt which guaranteed the machine "in perfect order when left here." On taking the engine down I find there are several things badly worn, such as the big end bushes, valve tappets and crank pin. A new set of valves will also be necessary. Can I legally claim any rebate from this man on the strength of his receipt, for, of course, this trouble could not arise in a fortnight?—F.G.

A guarantee to be binding must have been made before the actual purchase took place. In other words, it must be part of the inducement for the purchase. Probably this was so in your case; but if, after the machine was sold, the vendor voluntarily gave a receipt guaranteeing the machine to be in perfect order there would be difficulty. Was anything said about the condition of the motor cycle in the advertisement itself? It must also be borne in mind that it was only a second-hand machine, and the words "perfect order" would not imply that all parts of the machine are absolutely good, and you could not make a claim because certain parts are badly worn. Moreover, you appear to have kept the machine a fortnight before discovering any defects. Without further information, we can hardly recommend you to proceed for any rebate.

Charging Set.

? I have a 1 h.p. Auto-wheel engine which I propose to use to drive a small dynamo, provided I fit a cooling apparatus on it, to light my present residence, which is situated in the country. Will you kindly give me the following information: (1.) Is the 1 h.p. engine powerful enough to do the work? (2.) How many 25 c.p. lamps could I have lit at one time? (3.) What accumulators should I require for storage, and how long should I require to run dynamo daily to charge them? (4.) The best firm from whom to buy such a set and the approximate price?—A.J.D.B.

(1.) The 1 h.p. engine from an Auto-wheel will answer the purpose quite well provided you can make satisfactory arrangements for cooling. Probably you will do this with a fan. (2.) You do not give any idea of the size of your house or the total number of lights, but the 1 h.p. engine will give enough power for about ten lamps at once of 25 c.p., using metallic filament lamps of the ordinary type. This figure should be taken as a maximum, and will keep the engine working at its full power with consequent demand for efficient cooling. (3.) We should recommend you to adopt a twenty-five volt system, and for this you will require a dynamo with an output of thirty-five volts and about ten amperes, with fourteen accumulators. The length of running time will, of course, depend largely on the time of year, but, on the average, you will probably find two or three times a week sufficient, especially if you install accumulators of large capacity for the work. This is an important point. (4.) You will find the Crypto Engineering Co., 149, Bermondsey Street, S.E., a very good

firm to deal with in such a manner. They make a speciality of small sets like yours. We are unable to say anything about prices at the present time. By adopting twenty-five volts as your standard you would be able to make use of half-watt lamps, with a further reduction of current, and we should strongly recommend you to try them to secure the fullest economy.

Irregular Gas Generation.

? My head lamp and rear lamp are supplied with gas from one F.R.S. generator, and the light continually goes up and down. Sometimes it goes so low that the rear light goes out. I shall be much obliged if you can help me to discover the cause of the trouble.—E.A.C.

We should think that the water supply is irregular. Remove the needle valve, and see that the passage is quite clear by blowing through the top hole. Also see that the filtering material underneath the tank is not clogged and the small tube quite clear, and go over the distributing tubing to see that there is no water lying in it.

Lubrication.

? I have just read your reply to a correspondent in trouble with the plugs sooting up on his 4 h.p. Douglas. I have one of these machines, new this year, and am having the same trouble. So far as I know, the lubrication is taken out of the rider's hands, except in the case of the auxiliary feed to the front cylinder, and if you can tell me how to cut down the oil consumption, I shall be very much obliged. This machine consumes about four pints of oil in 100 miles, and the makers' instructions on the tank state that the sump must be filled every 100 miles. I have ridden my machine several hundreds of miles and have already had to remove the cylinders for the purpose of cleaning them out. I found the carbon deposit on the top of the pistons to be quite $\frac{1}{8}$ in. thick. After laying one of the cylinders on the bench for a few minutes, a small pool of oil collected on the bottom side. From what I can see of it, the pistons must be fairly bathed in oil. I am thinking of shortening the little dippers attached to the big ends. These dippers are about $\frac{1}{8}$ in. long, and the whole length dips into the oil. I thought of making them half this length. Shall I be causing any serious harm? There is a good description of the lubrication system in your handbook. This excessive oil consumption makes the machine expensive to run, and if you can help me, I shall be very grateful.—L.W.

There are two methods of reducing the oil supply: one is to remove the small screw at the bottom of the pump and take out the spring and ball which you find after removing the screw, or a better method would be to fit a longer screw with a locknut, by means of which you could alter the tension of the spring. We should advise you to send to Messrs. Douglas Motors, Ltd., 39, Newman Street, London, W.1, for their new booklet describing the 4 h.p. model. On no account interfere with the dippers.

EXPERIENCES WANTED.

"E.R.G.H." (Wimborne.)—Binks carburettor on $2\frac{1}{2}$ h.p. Douglas. Speed, acceleration, starting, m.p.g., and ease of fitting.

READERS' REPLIES.**Scott Timing and Lubrication.**

I notice in *The Motor Cycle* of June 5th, "W.C.S." is asking advice on these points, and that he cannot get his left-hand cylinder to fire. There is one thing he might verify, as I have had a very similar case to deal with and found it very puzzling till we hit upon the trouble, which we did quite by accident. The trouble was that the cranks had got out of time and were not spaced 180° apart. It would be well for "W.C.S." to take off both crank case covers and see that when one crank is on the top centre the other is on the bottom centre. I do not say this is the solution of the trouble, but I know it will cause the condition he complains of. The cure is to slacken the bolt which passes through the crank—it has a left-hand thread—and bring the two cranks opposite each other and tighten the bolt well; it will require a box spanner and is screwed up very tightly.—D. G. TAYLOR.

RECOMMENDED ROUTES.**KINGSTON TO BATH.—C.W.S.**

Slough, Maidenhead, Reading, Theale, Hungerford, Marlborough, Calne, Chippenham, Box, Bath.

BEAUFORT TO FISHGUARD.—J.W.C.

Beaufort, Tredegar, Merthyr Tydfil, Neath, Morriston, Pontardulais, Carmarthen, Newcastle Emlyn, Cardigan, Newport, Fishguard. Approximately 114 miles.

MANCHESTER TO CRICCIETH.—J.L.T.

Manchester, Altrincham, Northwich, Chester, Hawarden, Wrexham, Llangollen, Corwen, Bettws-y-Coed, Capel Curig, Beddgelert, Tremadoc, Criccieth.

LONDON TO THE WYE VALLEY VIA OXFORD.—D.E.J.

London, Brentford, Hounslow, Slough, Maidenhead, Henley, Nettlebed, Benson, Dorchester, Oxford, Witney, Northleach, Cheltenham, Gloucester, Newnham, Lydney, Chepstow, where you enter the Wye Valley.

HONITON TO HULL.—J.G.M.

Honiton, Ilminster, Ilchester, Sparkford, Bruton, Frome, Trowbridge, Melksham, Chippenham, Wootton Bassett, Swindon, Faringdon, Oxford, Baynards Green, Brackley, Towcester, Northampton, Kettering, Great Weldon, Stamford, Grantham, Lincoln, Brigg, New Holland, by ferry to Hull.

WANSTEAD TO BOURNEMOUTH.—A.E.E.

Wanstead, Lea Bridge Road, Dalston, Essex Road, Pentonville Road, Enston Road, Marylebone Road, Oxford and Cambridge Terrace, Bayswater Road, Shepherd's Bush Road, Hammersmith Broadway, Castelnau, Barnes, Roehampton, Kingston, Surbiton, Esher, Cobham, Guildford, Hog's Back, Farnham, Alton, Alresford, Winchester, Romsey, Cadnam, Ringwood, Christchurch, Bournemouth.

cases the articles ultimately find their way back to owners.

Patrols and Car Thieves.

The present epidemic of motor car thefts discloses additional evidence of the real utility of A.A. Patrols.

A member loses his car or motor cycle and telephones particulars immediately to the nearest A.A. Office. As soon as this information is received by the Association, a full description of the stolen vehicle is telephoned to the A.A. Branch Offices, and all the A.A. roadside sentry box telephones. The patrols in charge, in turn, pass the information to all other patrols in their districts

The hue and cry is raised!

When the car or cycle is seen, "necessary action" is taken to bring it to a standstill. If such action is unsuccessful, the patrols use the wires running from the A.A. roadside telephones, and other steps are taken to arrest the thief's progress.

Roadside Telephones.

A most valuable adjunct to the patrol service of the Automobile Association is the system of telephones installed by the roadside. These telephones are chiefly located at crossroads, sharp corners, and other danger points where motor cyclists can best be served by patrols on "fixed point duty."

The telephones can be used by members for all purposes, and are particularly useful to motor cyclists who desire to remain in touch with home and business during journeys. If a member's route is known, the number of his cycle can be 'phoned to selected sentry boxes. When the cycle passes it will be identified by means of the index mark, stopped by the patrol, and the member can communicate with his home or office.

Touring Facilities.

The Routes Department of the A.A. prepares routes and tours under the supervision of members of the staff who have personal and reliable knowledge of the districts suggested. This knowledge is augmented by road information obtained from members, patrols, surveyors, road-agents, and other correspondents.

The information given is thus complete and shows in a brief form:—

1. The roads best adapted to meet members' requirements.
2. The names of all towns and villages which are given on sign posts or are easily recognised on a motorist's map.
3. All turnings which are likely to be missed.
4. The distance between towns and the total mileage of the tour.
5. The chief places of interest along the route.

Information regarding hotels, garages, and agents is given in the A.A. Handbook (issued free to all members), so that a motor cyclist is never at a loss for a reliable hotel or garage.

Free Legal Defence.

The legal benefits offered by the A.A. to members include FREE LEGAL DEFENCE in any police court in the United Kingdom in respect of alleged offences under the Motor Car Act and Regulations. The benefit is open both to the member and to his paid driver, and the offences covered include—Driving Dangerously, Exceeding the Speed Limit, Obscured Numbers, Non-compliance with the Lighting Orders, and the many technical points raised under the Registration and Licensing Regulations, etc., etc.

FREE LEGAL ADVICE is also available to members on any matter connected with motor-

ing. This benefit includes such matters as Liability for Accidents on the Road, Claims for Damage in Transit, the Responsibilities of Garage Proprietors, Disputes over the Buying and Selling of Cars, Theft of Cars, etc., etc.

Other privileges enjoyed by members of the A.A. include Engineering Assistance, Special Insurance Facilities, "First Aid" machines, Foreign Touring Assistance, etc., etc.

The annual subscriptions, which run for twelve months from date of joining, are:—

Ordinary Member, £2 2s.	(Badge fee, 5/-)
Light Car Member, £1 1s.	(Badge fee, 4/-)
Motor Cycle or Cycle Car Member, 10/6	(Badge fee, 3/-)

Complete information as to the objects of the Association and the many privileges it extends to its members are contained in a recently published booklet entitled "The Key to the Open Road," a copy of which is obtainable on request.

All correspondence should be addressed to the Secretary, A.A. & M.U., 21, Farnham House, Whitcomb St., London, W.C.2.

Thick black lines show roads patrolled. Circles denote Area Headquarters and Branch Offices. Squares indicate Appointed Agents, Repairers, and Hotels, "North, South, East, or West," A.A. Service is the Best."

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—First 12 words or less 2/-, and 2d. for every additional word. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd.**, and crossed **& Co.** Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.4), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. 000, c/o "Motor Cycle," 20, Tudor Street, E.C.4. Replies to Box Number advertisements containing remittances should be sent by registered post.

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements some mention of the district in which the car offered may be seen and tried.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged; when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MODELS FOR
MOTOR CYCLES

from
2½ to 10 h.p.

The BRAMPTON

Bi-Flex

Spring Fork

—which, by reason of its vibration and shock-absorbing efficiency was, specified by the War Office for fitment to the Vickers-Clyno Motor Cycle Machine Gun Combinations. Motor Cycle Ambulance Combinations were also fitted with the Brampton Bi-Flex Spring Fork for the same reason, as well as large consignments of motor cycles which were shipped to the various theatres of the war for solo work. To ensure the maximum of comfort a wheel and to prolong the life of your motor cycle, you should specify and insist upon the fitment of the Brampton Bi-Flex Spring Fork.

HOME BOOT REPAIRING

"Elite Holdite Rivetless Soles."

Soles STUCK ON.—

We are now placing on the market an entirely new and Patented Rubber Sole. These soles are specially prepared with an adhesive surface, and fixed with Elite Holdite Sol-fix solution. We guarantee them to hold as firm as rivets or sewing. This process of fixing is exactly the same of that of repairing a punctured Motor or Motor Cycle tube. One of the many great advantages of our process is that the Boots or Shoes when fitted with our soles become absolutely waterproof. Full instructions given with each pair of soles.

PRICES:

Size.	Gents'.	Per Pair.

MOTOR CYCLES FOR SALE.

Ivy.

IVY 2½ h.p. 2-stroke, new May, 1919, footboards and horn, only done 50 miles; £47/10.—Macguire, 220, New Cross Rd., S.E. [4180]

T.T. Ivy-Jap, 1915, 6 h.p., 3-speed countershaft, new tyres, perfect condition; £80.—J. E. Delph, 36, Market Hill, Cambridge. [X4347]

IVY 2½ h.p., 2-stroke, Albion 2-speed, Senspray, drip lubrication, good Dunlop tyres and belt, climb sun-rising easily; £33.—Avoncarrow, Vincent Av., Stratford-on-Avon. [X4108]

BROOKLANDS Special Ivy. Having to abandon further competition work I offer what presents an unparalleled opportunity for sporting riders. My 1914 2½ h.p. Ivy-Green-Precision is for sale. The machine, which was built specially for me, is fitted with a truly wonderful little engine. I could have sold it favourably many times during the war, but saw little use in disposing of a little friend whom I could, under no circumstances, replace. I guarantee the machine capable of lapping Brooklands at 60 miles per hour average—in fact, on Brooklands, I consider the machine can hold its own with any other 2½ h.p. in England, bar one. Actual mileage covered does not exceed 100, and condition throughout coincides with that amount of careful use. I offer the machine complete, with new tyres, and belt, at £75.—J. W. Tollady (late B.M.C.R.C.), The Layton Garages, Bicester. Phone: 35. [X4326]

James.

JAMES—Sole agents for Hertfordshire. 1919 machines in stock—Chandler, Reyre and Williams Sun St., Hitchin. [0997]

BABY Levis 2½ h.p., lamp and generator, Bosch mag., new Dunlop (heavy), enamel good, runs well, reliable; 30 gns.—Homestead, Birchenhead. [X4314]

MONEY well spent

Not only do we claim for the **LAYTON GARAGES** "fullest Value for Money Spent" in Motor Cycle purchase, but, in addition, a Service which is **Personal, Courteous, Reliable!**

Here is confirmation—a few extracts from recent letters received from satisfied clients.

"I should like to take this opportunity of expressing my appreciation of the fair, courteous and businesslike manner in which you do your trade as experienced by me, and I shall always be pleased to recommend you."

"Shall only be too pleased to advise anyone to buy from you, for I know that they will get value for their money and A.1 treatment."

"I feel I must write and express my satisfaction with regard to the Combination, also with the straightforward manner in which you have dealt with me. I shall only be too pleased to recommend anyone who desires to be dealt with satisfactorily, to place themselves entirely in your confidence, knowing you will spare no efforts to get them what they desire."

"Your business method is most courteous and friendly, and we are very pleased and satisfied. It is the personal element that you put into the thing that makes dealing with you a pleasure."

And as we have pleased and satisfied others, so can we also please and satisfy YOU.

Write us re A.B.C., Ariel, Blackburne, Enfield, Ivy, New Imperial, Norton, Sparkbrook, and Triumph Motor Cycles, and Hillman, Standard, Singer, and Dawson Light Cars.

Phone: 4631 Hampstead.

How Can a Motor Cycle or Car be Mechanically perfect

unless it is overhauled from time to time? Many of our clients are surprised that we can give the prices we do for second-hand machines, and yet sell at such a reasonable figure. We buy a machine, and we overhaul it before we sell it. The vendor gets the value of the machine less the cost of overhaul. The purchaser gets the machine at its true value. Where do we come in? We make our profit on the overhaul—got it? Quick returns and small profits, that is our business motto. Bear these facts in mind when you contemplate a purchase. Forty-two fine bargains in stock ready for the road. Twenty going through the shops

347, FINCHLEY ROAD, N.W.3.

CHAIRMAN RHYMES.

*Just a kick!
Now then, quick!
How's the carburettor?
Loose the clutch,
Not too much—
Now she's pulling better.
Air like wine,
My! it's fine
Cycling from your troubles.
No alloy
To my joy
Which a CHAIRMAN doubles.
5½d. for 10 everywhere.
R. J. Lea, Ltd., Manchester.*

THE MOTOR CYCLE ROAD MAPS

Set of Three complete in Case.

**ENGLAND & WALES
SCOTLAND**

LONDON

Showing Roads into and out of
London, and avoiding London.

Specially prepared for the use of Motor Cyclists
by Messrs. J. Bartholomew & Co., Edinburgh.

The handiest and most compact set of maps
yet produced for Motor Cyclists. Invaluable
for planning a tour or for choosing a route
while on the road. All essential detail is given.

The map of London has been specially
prepared, and is unique in character, as it
shows not only how to get into or out of
London, but also how London may be avoided.

Mounted on Linen.

PRICE, for the Set complete in case, 4/6 net. By post, 4/10.

STANDARD AND SIMPLEX

BRITISH BELT FASTENERS

Are made from the same material as a high-grade sword. Their work necessitates it, their behaviour proves it, their excellence has caused them to be **SELECTED FOR USE BY THE FRENCH WAR DEPARTMENT.**

"Standard" Adjustable 1/3.

An ample margin of safety is assured by making sure of the right shape and of the right metal. Strength is secured by correct design and the use of the highest grade material of excessive toughness.

The "SIMPLEX" Hook is an improved model of the original Hook Fastener; the "SIMPLEX" Adjustable offers the same pattern complete with three links of varying lengths.

The "STANDARD" Hook is provided with hinged joints, giving maximum grip of the belt ends. The "STANDARD" Adjustable is the hinged pattern with adjustable lengths, $\frac{1}{8}$ in., $\frac{1}{4}$ in., and $\frac{1}{2}$ in.

All Agents stock them: full details free on request.
